

## Virtual Database CLI Commands

SQL Safe provides you with CLI commands to help you manually create virtual databases.

To perform operations use the following commands:

Commands	Description
SQLvdbCmd <action> [options]	Perform an action.
SQLvdbCmd help <action>	Display detailed help for an action.
SQLvdbCmd -ArgsFile <filename>	Perform the action defined within an argument file.

Where:

Action	Description
<action>	A keyword that tells SQLsafe what to do.
<filename>	Specifies the file that contains command line arguments.

When you use the *sqlvdbcmd* command, the following actions can be performed:

Action	Description
<a href="#">Help</a>	Display more detailed help.
<a href="#">Map</a>	Generate maps (for InstantRestore or SQL virtual database).

For detailed descriptions and available options, see the CLI Help (`SQLvdbCmd help`).
