

Define folders for file system permissions checks

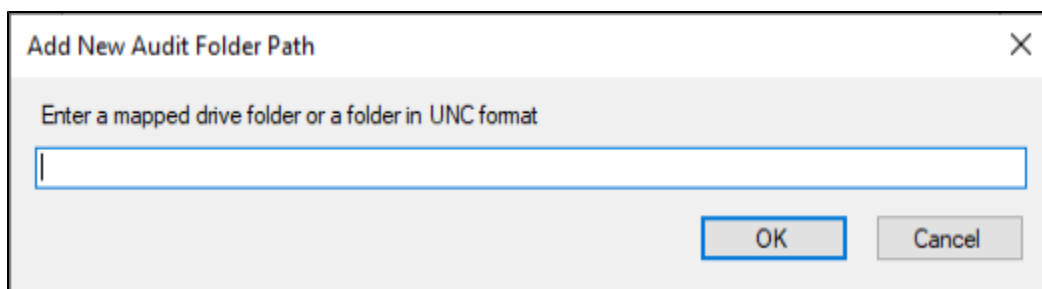

In the **Specify Audit Folders** section, you can select which folders will be audited for collecting file system permission information.

 Amazon RDS accounts do not have this option available.

The dialog box titled "Register a SQL Server" has a sub-header "Specify Audit Folders" with the instruction "Specify folders to be audited for collecting file system permission information". It features a large empty rectangular area for listing folders. Below this area are three buttons: "Add", "Edit", and "Remove". At the bottom of the dialog are four buttons: "< Back", "Next >" (which is highlighted with a blue border), "Cancel", and "Help". A small icon of a server stack with a green plus sign is located in the top right corner of the dialog area.

Click **Add** and type a mapped drive folder or a folder in UNC format. You can add as many folders as you require.

The dialog box titled "Add New Audit Folder Path" contains a text input field with the placeholder text "Enter a mapped drive folder or a folder in UNC format". Below the input field are two buttons: "OK" (highlighted with a blue border) and "Cancel".

If you want to change or delete any of the previously added folders, click **Edit** or **Remove** respectively.

Click **Next** to go to [adding Server Group Tags](#).
