

Data Integrity Security Checks

The Data Integrity Security Checks monitor that SQL Secure data is not missing or out of date.

The Data Integrity Security Checks available on the Configure the Policy section are the following:

Name	Description
Audit Data Is Stale	Determine whether the nearest snapshot collection occurred within an acceptable timeframe from the selected date
Baseline Data Not Being Used	Determine whether all audit data for the selected timeframe is from baseline snapshots
Snapshot May Be Missing Data	Determine whether all audit data for the selected servers is complete and without warnings
Snapshot Not Found	Determine whether all servers in the policy have valid audit data for the selected timeframe
