

Top Logins

Provides a list of logins executed in the monitored instances. This information identifies where the user was accessing the system from and other SQL statements. The list also defines the type of user, the total workload in the DB (measured in seconds), and the number of executions.

Click any of the listed Logins to obtain more information on the selected Login. SQL Workload Analysis redirects you to the Login page where it shows the top waits and their trends, the top databases, the top SQL statements, the top machines, and the top programs. On the left side of the screen, you find the list of Logins to help you a faster access to any other Login that you need.
