

# View status of a specific restore policy

When a specific restore policy is selected from the Restore Policies tree node, the content pane displays information describing the status of that policy. Use this view to determine which restore operations initiated by the policy have succeeded or failed.

## What actions can I perform?

### From the Policies tree

By right-clicking a policy under the Restore Policies node, you can access the following shortcuts:

Action ...	What it does ...
Create Restore Policy	Opens the Restore Policy wizard, allowing you to create a new policy.
Edit Policy	Opens the Restore Policy wizard (with all options pre-set to the values used for this operation), allowing you to edit any of the options.
Delete Policy	Allows you to delete the policy. Although restore operations associated with this policy will no longer be performed, the previous status messages returned by this policy will continue to be stored in the SQL Safe Repository.
Disable Policy	Allows you to disable of the selected policy. Restore operations associated with this policy will no longer be performed.
Start Jobs for Policy	Allows you to run the restore job associated with this policy, performing an ad-hoc restore with the options already set by the policy.
Refresh Policy List	Updates the Restore Policies node with the latest policies.

### From the Current Status pane

By clicking the links available in the Current Status pane, you can access the following shortcuts:

Action ...	What it does ...
View Policy Settings	Allows you to view a summary of the policy settings.
Edit Policy	Opens the Restore Policy wizard, allowing you to change your policy settings.
Disable Policy	Disables the selected policy. Once a policy is disabled, it will no longer perform restore operations for the associated databases. To recover a database that belongs to a disabled policy, perform a manual restore using the <a href="#">Restore wizard</a> .
Start Restore	Performs a full restore of all databases that belong to this policy by running the corresponding job. This action applies your previously defined policy settings.

### From the Operation Summary grid

By right-clicking on an operation, you can access the following shortcuts:

Action ...	What it does ...
View Details	Shows the Details pane, providing additional information about the selected operation.
Restore again	Runs the restore operation again, using the same settings.
Restore with different options	Opens the Restore wizard (with all options pre-set to the values used for this operation), allowing you to specify different options before running the operation.
Set Progress To	Allows you to change the status of the selected operation.
Close Details	Hides the Details pane.

## What does the Current Status mean?

The Current Status displays the most recent, combined status of the restore operations performed by this policy. When there are multiple operation statuses, the policy status reflects the most critical operation status. When all restores have been completed successfully according to the policy schedule, a green OK icon is displayed.

## What is the Last Operation Status?

The Last Operation Status shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. The operation status is limited to restore operations performed by this policy.

## What are the Operation Details?

The Operation Details grid displays a listing of all restore operations performed for the databases included in the selected policy for the last 7 days. This grid includes the following columns:

Column	Definition
Progress	During an operation, the progress bar will denote the percentage of the operation completed. When the operation is complete, it will display a green bar labeled 100%. If an operation completed with errors, this column will display a red bar labeled Error.
Instance	Displays the instance name that was restored by this operation.
Database	Displays the database name that was restored by this operation.
Operation	Confirms that a restore operation was performed.
Backup Type	Displays the type of backup restored by the operation. Currently, only the recovery of full backups is supported by the restore policy.
Compressed	Displays the compressed file size of the backup used in this restore.
Ratio	Displays the percentage of the data that was compressed in the associated backup.
Compression	Displays the <a href="#">type of compression</a> that was used for the associated backup.
Duration	Displays the number of seconds required to complete the restore operation.
Start Time	Displays the start date and time of the restore operation.

## Can you customize the columns in the Operation Details grid?

You can sort by the content of any of the columns by clicking the column header.

You can select which columns are visible in this grid, and enable column grouping, by clicking the **Filter** icon in the pane title bar.

## How do you refresh the data displayed in the Operation Details grid?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

## What are the details?

To see the detailed results of a specific operation, right-click the operation in the Operation Details grid and select **View Details**. The Details pane displays below. By default, this pane is hidden.

The Details pane provides the following information about the selected backup operation:

Tab	Description
Statistics	Displays the database size, the size of the uncompressed backup, the size of the compressed backup, and the compression ratio achieved with this backup. The ratio is a measure of the storage savings achieved with SQL Safe compression technology. For more information about the storage space savings you can realize using SQL Safe, see <a href="#">Understand your total cost of operation (TCO)</a> .
Result Text	Displays text describing the result of the restore.
Files	Displays the complete path of the backup set file for the restore.

Backup Set Description	Displays the description you specified for this restore.
Storage Options	Displays which locations were chosen to store the backup files associated with the restore.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >
