View filters for a snapshot

The IDERA SQL Secure **Filter** tab lists the collection filters that SQL Secure uses to collect audit data from your registered SQL Server instances and to create a snapshot. Each filter rule defines which data, such as permissions on user tables in a specific database, is collected and included in this snapshot. For more information about how filters work, see Use Filters to Specify which Data is Collected.

SQL Secure tells you who has access to what on your SQL Server databases. Learn more > >
