

# Query Wait Statistics

The Query Wait Statistics report lets you analyze different wait type categories on your SQL Server instance. By analyzing these waits you can better determine where your biggest bottlenecks are occurring and what changes could have the greatest performance impact. You can select from various wait type categories such as **Backup**, **Excluded**, **I/O**, **Lock**, **Memory**, **Non-I/O Page Latch**, **Non-Page Latch**, **Transaction Log**, and **Other**.

This report requires that you enabled Query Monitoring in the SQL Diagnostic Manager Console and have collected sufficient query data for the specified time period.

## When to run this report

You should run the Query Wait Statistics report on a routine basis, such as every week, to proactively identify potential performance issues that may be caused by queries.

## How SQL Diagnostic Manager calculates metric values on this report

Most values on the Query Wait Statistics report correlate with the related SQL Server metric. However, some metric values represent averages over time. Likewise, a few metric values are based on performance algorithms that use multiple statistics to calculate a more accurate metric.

You can access our [Customer Support Portal](#) for more information about the algorithm used to calculate a specific metric.
