Search a Project

To search an existing project

1. Select **Search > File**.
2. Specify the search criteria:
   - Type the value to search in the **Containing Text** field. Use the * character to indicate wildcard string values, the ? character to indicate wildcard character values, and the \ character to indicate an escape character for literals (* ? /).
   - Select **Case Sensitive** and indicate to the search function that it should take into account case when searching for appropriate string matches.
   - Select **Regular Expression** to indicate to the search function that the string is a regular function.
   - In the **File Name Pattern** field, specify the extension name of the files to search for explicitly.
     If the value in this field is a * character, the search function searches all files regardless of extension. Manually type in the extensions to indicate file type (separate multiple file types with commas), or click **Choose** and use the Select Types dialog to select the file extensions the process will search for the string by.
   - Select **Consider Derived Resources** to include derived resources in the search.
   - Select **Workspace** or **Working Set** to choose the scope of the search. If you choose **Working Set**, specify the name of the defined working set manually, or click **Choose** and navigate to the working set you want to search for in the provided string.
3. Click **Search**. The results of your search are generated in the Search view on the Workbench.
