

Adding SQL Server instances

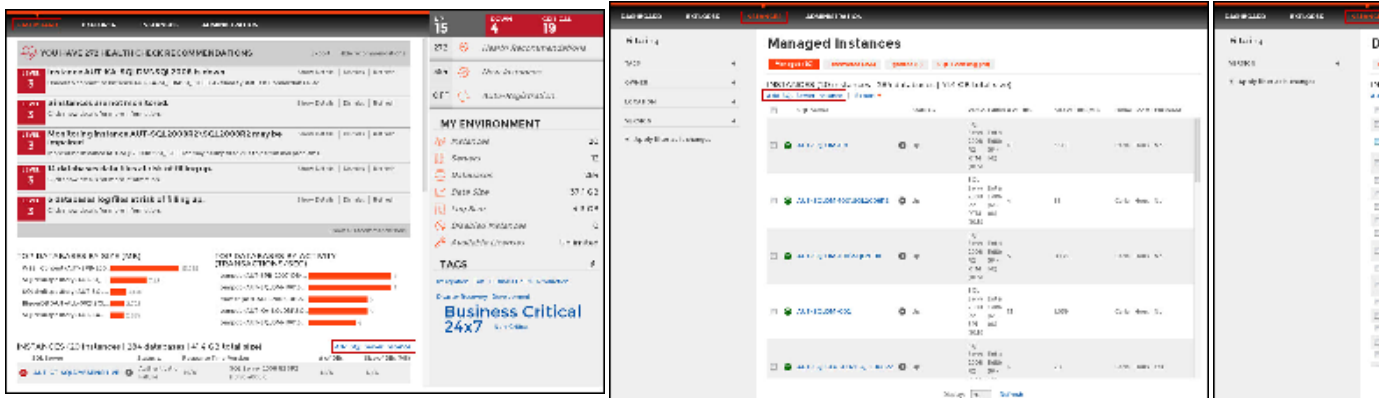

[Click here for 1.0 Documentation](#)

In order to manage an instance, access its details, and add it to your monitored environment, you need to register it with SQL Elements. This section helps you register one or more instances with SQL Elements.

You can find the **Add SQL Server Instance** option on the following views:

- **Dashboard** - top right section of the instances table.
- **Instances** - action items bar of the Managed, Discovered, Ignored, and SQL Licensing sections respectively.
- **Administration** - instances section.

Below you can see the tabs and sections where you can find **Add SQL Server instances**. Click the image to view full size.

The Add Instance Wizard contains the following four sections:

1. Instance

- Type the name of instance or instances you want to register in the **SQL Server Instance** box. Use a semicolon to separate instances.

Tip

When you select instances on the **Discovered** or **Ignored** Instances views, the wizard already adds them to this box.

 **Tips**

Specify the SQL Server instances you want to register with SQL Elements for monitoring. Separate multiple instances with a semicolon.

Use the Browse button to get a list of instance names discovered by the SQL Elements service.

2. Credentials

SQL Elements connects to registered SQL Server instances and their host computers to collect information. The collection service requires permissions to connect and gather information using the following types of connections:

- SQL connection credentials to perform queries against registered instances
- WMI connection credentials to gather data from the host computers

Tip

For more information on what are the minimum required permissions for these accounts, click [here](#)

Authorize WMI users and set permissions

If you want to know how to authorize WMI users and set permissions, click [here](#).

By default, SQL Elements connects using the SQL Elements Service Account. However, if you need to provide alternative credentials for any of these two connections, you can choose from the respective options on each section.

SQL Connection Credentials

- Specify the type of account that you want to use to access your SQL Server instance and collect its information. If you do not want to use the **SQL Elements service account**, you can choose to use a **Windows user account** or a **SQL Server login account** from the **Account Type** list.

Tips

Specify the credentials used by SQL Elements to gather data about your instances. Choose whether you want to use the SQL Elements service account or an alternate account for each type of connection.

SQL Connection credentials are used to connect and perform queries against registered instances to collect configuration, availability, performance and capacity data.

WMI Connection credentials are used to connect to the instance's host computer to gather configuration and performance data.

- If you choose to use a **Windows user account**, type the respective user name and password. This account allows you to access Windows configuration data of the computer that hosts the registered instance.

Tip

Idera recommends that you use the **Test Credentials** option to verify that SQL Elements can successfully monitor the newly registered instances.

3. Information

On this section you can specify additional information for your instances like **Owner**, **Location**, **Comments** and **Tags**.

Although none of these fields are required, Owner, Location, Comments and Tags provide a powerful method for grouping instances and help you organize your managed instances. You can use these options to view information such as database counts, size, or activity, grouped by these fields.

Use the **Owner** and **Location** drop down lists to access all available options.

 **Tips**

Specify information to help you organize your managed instances.

SQL Elements will allow you to view and compare information about your instances by Owner, Location and Tags.

For example, this information will let you view data for all the SQL Servers in Houston, owned by the Accounting department or by SQL Server version.

Access the full list of tags by clicking the See All Tags link. You can specify one or more tags for a single instance.

Warning

- The tag name must begin with an upper or lowercase alphanumerical character.
- Your tag name must have a maximum length of 20 characters.
- Only the following special characters are valid for tags: ! # @ () ' . : - _ and embedded spaces.

Tip

Refer to the [Managing Tags](#) section for more guidance on how to add, view, edit, or delete tags.

4. Finish

On this section, you can review your Instance Registration Details such as: instance name, SQL Connection Credentials, WMI Connection Credentials, Owner, Location, Comments, and Tags.

To change any of these registration details you can do one of the following:

- You can click any of the title sections (INSTANCE, CREDENTIALS or INFORMATION) and go directly to the place where you need to make the changes.
- You can click **PREV** to go back to the previous sections until you find the place where you need to make changes.

 **Tips** 

Review all the details of the SQL Server instances that you are registering. You can go back to previous steps if you want to change some information.

CANCEL

After you review your registration details click **FINISH**. SQL Elements begins to collect instances information after a few minutes of their registration and will continuously collect availability, performance, and configuration information from them and their host computers.

Tip

After registration, you can still change credentials, tags, and information settings on the **Edit Properties** option. Refer to [Editing instance properties](#) for more information.

About collection intervals

Collection intervals are predefined. You can see more information about collection frequency on the [What Health Checks are available in SQL Elements?](#) section.

You can also force data collection for an instance by selecting **Refresh Data** on the **Instance details** view. For more information, refer to [Viewing instance details](#).
