

Issues fixed by this release

The following issues have been fixed and no longer represent an issue for 1.1:

- When solving an issue related to data/log at risk of running out of space, the alert no longer appears on the Health Check Recommendations section.
- Last DBCC CHECKDB performed date in the Database Details view currently shows the correct date for new databases.
- The user will no longer find the following message: 'Failed to process setAttr Failure (NS_ERROR_FAILURE)' when adding SQL Server instances in Mozilla Firefox 24.0 and Internet Explorer 8.
- Discovery is not anymore only done on the local subnet. Now the user can specify the IP Addresses and Domains for the discovery job.
- The list of discovered instances no longer includes host servers that do not have default SQL server instances.
- Validation has now been implemented to confirm that the "domain\username" format is being used when adding new users.
- When refreshing health check recommendations on the dashboard, the user no longer finds that the status is not refreshed. It is now automatically refreshed.
