Backup Agent License CLI Commands

SQL Safe provides you with CLI commands to help you manually register a backup agent license.

To perform License operations use the following command:

- SQLsafeCmd License <sql_server> <license_key> [options]

Where:

Action	Description
<sql_server>	The full name of the SQL server instance to license. E.g. HOSTNAME\INSTANCE
<license_key>	The license key.

And the [options] are:

Option	Description
-ForceLocal	Forces the installation of a license to the local machine, although <sql_server> might refer to another machine. Note: it is necessary in clustered environments where a clustered SQL Server instance name differs from the physical node hosting it.

For detailed descriptions and available options, see the CLI Help (SQLsafeCmd help License).
