

Schema Compare Scripting Options

By default the IDERA Schema Compare for Oracle Database includes almost all elements in the synchronization script, however, a large number of scripting options allow the user to exclude any element they want. For example the user may decide that h/she does not want to script parallelism, or column encryption, or Xml Storage etc.

The scripting options are self-explanatory. A checked option indicates that that particular element is scripted whereas, un-checking or clearing the option causes the exclusion of that element from the synchronization script. Similar to Comparison Options, the Scripting Options are separated into two tabs, the first one contains the more common options and the second tab (Advanced Scripting Options) contains less common options that most users would not need to change.

The screenshot shows the 'IDERA Schema Compare for Oracle Database - Comparison Options' dialog box. The 'Scripting/Execution Options' tab is selected. The dialog has a title bar with a close button (X). Below the title bar is a header bar with the text 'View or change the comparison options'. The main area contains several sections of options, each with a group box header and a list of checkboxes:

- Scripting Options**
 - ☒ Always include dependencies of user-selected objects
 - ☒ Turn off Recycle Bin (Oracle 12)
 - ☒ Script Compression of Tables and Indexes
 - ☒ Script Parallelism
 - ☒ Script ASC/DESC of Index Columns
 - ☒ Script View Column Aliases
- Table Scripting**
 - ☒ Script Lob
 - ☒ Script V-Array
 - ☒ Script Nested Tables
 - ☒ Script Supplemental Logging
- Column Scripting**
 - ☒ Script Encryption
 - ☒ Script Default Value
 - ☐ Script Identity Sequence
- Storage Scripting**
 -

At the bottom of the dialog, there are four buttons: 'Restore Default Options', 'Toggle Advanced Options' (which is highlighted with a blue border), 'OK', and 'Cancel'.
