

# Find and Fix SQL Code Errors

The SQL Errors view contains an option that enables you to navigate directly to the resource associated with an error entry.

```
CONSTRAINT pjob
PRIMARY KEY CLUSTERED (job)
)
go
IF OBJECT_ID('dbo.benson') IS NOT NULL
PRINT '<<< CREATED TABLE dbo.benson >>>'
ELSE
PRINT '<<< FAILED CREATING TABLE dbo.benson >>>'
go
```

## To navigate to the source of a SQL error entry

Right-click the entry to which you want to navigate and select **Go To**. The file to which the error applies automatically opens in a new instance of SQL Editor, and the line is highlighted in the window.
