

# Add users to SQLdm

The Add Permission wizard allows you to give SQLdm access to a specified login in your environment. By default, all users belonging to the sysadmin role on the SQLdm Repository have SQLdm Administrator privileges and all other users are denied access to any of the monitoring and diagnostic views in SQLdm.

Logins belonging to the sysadmin role on the SQLdm Repository have SQLdm Administrator privileges and you cannot edit or delete these accounts.

Each login account can have multiple permissions associated with it. For example, if you want User A to have the ability to view all your SQL Server instances but modify only one of them, you can create two permissions. Include View permissions in the first login to allow the login to view all your SQL Server instances, and enable Modify permissions for the specified SQL Server instance in the second login.

If a SQL login is entered and it does not already exist, a new login account is created on the SQLdm Repository SQL Server instance.

## To create a SQLdm login account:

1. Click **Administration > Application Security**.
2. Click the **Add** button on the Application Security window.
3. Click **Next** on the Add Permission wizard Welcome window.
4. Type either the Windows account or SQL login used to connect to the SQLdm Repository.
5. Select the **Authentication** type and click **Next**.
6. Select the [type of SQL Server instance permissions](#) to grant to the specified account and click **Next**.
7. Select the tags or SQL Server instances to apply the permissions to and click **Add** to move them to the Selected Servers column and click **Next**.
8. Review your changes on the Summary window and click **Finish** to add the SQLdm login.

SQL **Diagnostic Manager** identifies and resolves SQL Server performance problems before they happen. [Learn more](#) > >
