

View your SQL Server queries information

The Queries tab of the single instance dashboard lists each event that occurs in the Query Monitor and allows you to easily explore query data in multiple ways and get a handle of query performance in your environment.

The Queries tab provides a highly usable and customizable Main Query view along with two low-level views which you can navigate to for root cause analysis:

- [Query Signature view](#)
- [Query Details view](#)

The Main Query view consists of the following major components that allow you to customize your view:

- [View selection and grouping](#)
- [Filtering](#)
- [Time](#)
- [Data view](#)

Select the type of view that you want displayed

The View Selection of the Main Query view allows you to choose from a variety of views to explore query data. The following views are available:

- Duration (ms)
- CPU Time (ms)
- Reads
- Writes
- I/O (sum of reads and writes)
- Blocking Duration (ms)
- Wait Duration (ms)
- Deadlocks

Duration (ms) is the default view of the Main Query view.

Use Group By to organize your view

Once you have selected a view, use the **Group By** option to choose from the following type of objects for query aggregation:

- Application
- Database
- User

- Client
- Query Signature

 Application is the grouping by default in the Main Query view.

Use Filtering to customize your view

Filter options in the Main Query view allow you to focus only on the information you want to be displayed. You can include or exclude specific applications, databases, users, SQL text, and more from the Query Monitor results through filters. The following filter options are available:

- Application
- Databases
- Users
- Clients
- SQL (Include SQL text matching or exclude SQL text matching)
- [Advanced Filters](#)

Select a time period to display query data

You can choose the time period to display in the Main Query view. This selection limits the queries to only those that run during the specified time period. You can select from a broad range of built-in time periods or specify start and end dates, and times for the period. The **Time** box includes the following options:

- Last 30 minutes
- Last 1 hour
- Last 4 hours
- Last 8 hours
- Last 24 Hours
- Last 7 days
- Last 30 days
- Custom

 By default only queries that start within the time period are shown. If you want to modify this behavior, the Advanced Filters option lets you include incomplete queries or overlapping queries. For more information, see [Advanced filters](#) of the main query view.

 To switch to a shorter time frame, click the larger time bucket. For example, clicking a month in a monthly graph modifies the time period to the selected month and grouping to days.

Analyze your query data

On the right-hand side of the overall view, query data is displayed based on your View, Group By, and filtering selections. The Data view is designed to provide good visualization of the selected data and enable you to drill down into problem areas. The Data view is composed of the following elements:

Header

Provides View, Group By, Period, and filter criteria information.

Graph

Chart area which displays the aggregated query results that meet the filtering criteria.

List

Displays data selected for the view in list form. There are several [list options](#) according to your **Group By** selection in the Main Query view.

The table below shows what options you have to drill down from the graph or list and get more specific information:

Click the...	Access the...
Application Name	Query Signature view
Database Name	Query Signature view
User	Query Signature view
Client	Query Signature view
Query Signature	Query Statement view

You can return to the higher level view by clicking  by the list name.

Access the Queries tab

SQL Diagnostic Manager provides two paths to access the Queries tab. The first access path is by selecting the Queries tab of the single instance dashboard. You can also click the query category icon of a specific instance in the thumbnail sub-view.

SQL Diagnostic Manager identifies and resolves SQL Server performance problems before they happen. [Learn more >>](#)
