

Virtual Database CLI Commands

SQL Safe provides you with CLI commands to help you manually create virtual databases.

To perform operations use the following commands:

| Commands | Description |
|--------------------------------|---|
| SQLvdbCmd <action> [options] | Perform an action. |
| SQLvdbCmd help <action> | Display detailed help for an action. |
| SQLvdbCmd -ArgsFile <filename> | Perform the action defined within an argument file. |

Where:

| Action | Description |
|------------|--|
| <action> | A keyword that tells SQLsafe what to do. |
| <filename> | Specifies the file that contains command line arguments. |

When you use the *sqlvdbcmd* command, the following actions can be performed:

| Action | Description |
|----------------------|---|
| Help | Display more detailed help. |
| Map | Generate maps (for InstantRestore or SQL virtual database). |

For detailed descriptions and available options, see the CLI Help (*SQLvdbCmd help*).
