

Select recovery state

The **Recovery State** tab of the Restore wizard allows you to choose the recovery state each database should be left in after the restore.

✔ Fully accessible is the only recovery state supported by the InstantRestore feature. If you choose a partial recovery state, you cannot restore your database using InstantRestore. For additional information about performing an InstantRestore, see [how InstantRestore works](#).

Which recovery states are supported?

SQL Safe supports the following recovery states:

- **Fully Accessible**. Leaves the database operational. No additional transaction logs can be restored. Note that you must use this fully-operational recovery state to use InstantRestore.
- **Not Accessible** (no recovery mode). Leaves the database non-operational, but able to restore additional transaction logs.
- **Accessible but read-only** (standby mode). Leaves the database read-only and able to restore additional transaction logs. You can specify an **Undo file** for this option.

Once you select the recovery state, click **NEXT** to [select the restore type](#).
