Select the target database where you want to mount your virtual database

The **Target** tab of the Virtual Database Wizard allows you to select the SQL Server instance where you want to mount the virtual database.

In this section, you can select from the drop-down list the SQL Server instance where you want to mount a virtual database. If your instance is not displayed, register it by using the Register SQL Server option.

Once you select the target instance you want to mount a virtual database from, click **NEXT** to select databases.
