Data Integrity Security Checks

The Data Integrity Security Checks monitor that SQL Secure data is not missing or out of date.

The Data Integrity Security Checks available on the Configure the Policy section are the following:

| Name | Description |
|---------------------------------|--|
| Audit Data Is Stale | Determine whether the nearest snapshot collection occurred within an acceptable timeframe from the selected date |
| Baseline Data Not Being Used | Determine whether all audit data for the selected timeframe is from baseline snapshots |
| Snapshot May Be Missing Data | Determine whether all audit data for the selected servers is complete and without warnings |
| Snapshot Not Found | Determine whether all servers in the policy have valid audit data for the selected timeframe |
