

Windows Server 2012 and later clustered environment

Registering the SQL Safe Backup services with Microsoft Failover Cluster Manager allows the Microsoft Cluster Service to manage the services in failover situations. The following configuration ensures the high availability of the services during a failover.

There are two ways to register the SQL Safe Backup services as a clustered resource:

- [Creating a new role for the SQL Safe Backup services.](#)
- [Adding the SQL Safe Backup services to an existing role.](#)
