Deploy SQL Compliance Manager in a Windows Server 2008 clustered environment

The following instructions guide you through the installation of IDERA SQL Compliance Manager in a Windows Server 2008 based clustered environment. Be sure to have the following information available before creating the generic service:

- Name of the disk containing the folder
- SQL IP address
- SQL network name
- SQL Server service

Install the SQL Compliance Manager Collection Service on Cluster Nodes

You must install the SQL Compliance Manager Collection Service on each cluster node for the service to work correctly when a failure occurs on the primary cluster node hosting the Collection Service.

Before upgrading, changing, or uninstalling SQL Compliance Manager on the passive node, you must delete the following registry entry: HKEY_L OCAL_MACHINE\Software\Idera\SQLcompliance\CollectionService\TraceDirectory. This step is unnecessary for new installations.

To install SQL Compliance Manager services on cluster nodes:

- 1. Log on with an administrator account to the computer on which you want to install SQL Compliance Manager.
- $2. \ {\tt Run \, Setup.exe} \ in the \ root \ of \ the \ {\tt SQL \, Compliance \, Manager \, installation \, kit \ on \ the \ first \ cluster \ node. }$
- 3. Under Install, click SQL Compliance Manager.
- 4. Read the Welcome window, and then click Next.
- 5. Review and accept the license agreement by clicking I accept the terms in the license agreement, and then click Next.
- 6. Accept the default installation folder, or click **Browse** to specify a different folder, and then click **Next**.
- 7. Select the Clustered Collection Server setup type, and then click Next.
- 8. Check the **Install the Collection Server in a Windows Cluster** check box to note that you are installing the SQL Compliance Manager components in a cluster. *If you leave this box unchecked*, the installer performs a **Typical** installation.
- Select whether you are installing the Collection Service on the Currently Active Node or A Passive Node, and then click Next.
- 10. If you install on the currently active node, specify a trace directory on a shared disk, and then click Next. If you install on a passive node,
- continue with the next step.
- 11. Type the service account information, and then click Next.
- 12. Accept the default SQL Server hosting the Repository, or click Browse to specify a different server.
- 13. Select the authentication method used to install the Repository database and include credentials, if required, and then click Next.
- 14. Click Install.

(i)

15. In Windows Services, stop the SQL Compliance Manager Collection service and set the Startup type to Manual.

Repeat the previous steps on each cluster node. Point to the SQL Compliance Manager Repository installed on the first node.

You cannot perform the installations concurrently, as the installers collide when checking the repository. You must perform the installations sequentially.

Create the clustered service resource

After installing the SQL Compliance Manager Collection Service on your cluster nodes, create the clustered service resource to allow SQL Compliance Manager to recognize the cluster nodes.

To create the clustered service resource:

- 1. Log onto the currently active cluster node using an administrator account, and then start the Microsoft Failover Cluster Management Console.
- Under Service and Applications, select the application for the SQL Server instance hosting the Repository, and then add a resource as a Generic Service.
- 3. Select SQL Compliance Manager Collection Service, and then complete the wizard to create the service.
- 4. Right-click the SQL Compliance Manager Collection Service in the Other Resources list, and then select Properties.
- 5. Type the Network Name for the SQL Server, and then click Apply.
- 6. On the Dependencies tab, complete the following fields:
 - a. Name of the disk containing the folder
 - b. SQL IP Address
 - c. SQL Network Name
 - d. SQL Server service
- 7. On the General tab, check the Use Network Name for computer name check box.
- 8. Click Add to add a new root registry key.
- 9. Type Software\Idera\SQLcompliance, and then click OK.
- 10. Start the new generic service by bringing the resource online.

SQL Compliance Manager audits all activity on your server. Learn more > >
