

SQL Safe Backup[®]

Version 8.0

Table of Contents

1. SQL Safe Release notes	7
1.1 New features and fixed issues	8
1.2 Previous features and fixed issues	10
1.3 Known issues	15
1.4 Recommended Idera Solutions	21
2. Welcome to SQL Safe	22
2.1 What is SQL Safe?	23
2.2 How does SQL Safe help me?	24
2.3 Find Answers	25
2.3.1 Document conventions	26
2.3.2 How to use the Help	27
2.3.3 Definition of terms	28
2.4 About Idera	29
2.4.1 Contact Idera	30
2.4.2 Idera products	31
2.4.3 Legal notice	32
3. Get Started	36
3.1 Upgrade to this release	37
3.1.1 Perform a staged upgrade	40
3.1.2 Perform a typical upgrade	41
3.1.3 Upgrade deployed Backup Agents	42
3.1.4 Upgrade the Lite or Freeware Edition	44
3.1.5 Upgrade the SQL Safe Freeware Edition	45
3.1.6 Deploy the SQL Safe XSP	46
3.2 Upgrade SQL Safe in non-trusted domains	47
3.3 Installation and deployment	49
3.3.1 Product components and architecture	50
3.3.2 Hardware requirements	52
3.3.3 Permission requirements	53
3.3.4 Port requirements	56
3.3.5 Software requirements	57
3.3.6 TSM requirements	60
3.3.7 Supported installation scenarios	61
3.3.8 How to install SQL Safe	63
3.3.9 Install SQL Safe Backup Agent	66
3.3.10 Deploy the Backup Agent	67
3.3.11 Using SQL Safe on a Microsoft Windows Cluster environment	68
3.3.11.1 Installing management components in a clustered environment	70
3.3.11.2 Installing backup/restore components in a clustered environment	73
3.4 Configure your deployment	75
3.4.1 Configure e-mail settings	76
3.4.2 Configure Console preferences	78
3.4.3 Configure the Management Service	80
3.4.4 Import archived backup sets	82
3.4.5 Manage licenses	83

3.4.6 Backup Agent configuration	86
3.4.7 Modify Backup Agent properties	88
3.4.8 How the IR Service works	90
3.4.9 Modify your SQL Server list	91
3.4.10 Register an instance	92
3.4.11 Understand total cost of operation (TCO)	93
3.4.12 Manage debug settings	94
3.5 View enterprise status for last 24 hours	96
3.6 View SQL Server status	100
3.6.1 View backup/restore operation status	102
3.6.2 View operations status summary	105
3.6.3 View server status details	106
4. Define your Backup and Recovery Strategy	107
4.1 How the Backup Agent works	109
4.2 How to choose backup type	110
4.3 How to choose compression and encryption	112
4.3.1 Ensure FIPS compliance	113
4.3.2 Understand compression levels	114
4.3.3 Understand encryption levels	116
4.3.4 Understand IntelliCompress	117
4.4 How script generation works	118
4.5 How threads affect backups and restores	119
4.6 Recover objects using SQL virtual database	120
5. Automate Backups and Restores	122
5.1 Deploy maintenance plans using SQL Safe	123
5.2 Backup policies	125
5.2.1 Create a backup policy	127
5.2.1.1 Name the policy	128
5.2.1.2 Select databases	129
5.2.1.3 Configure options	130
5.2.1.4 Select location	133
5.2.1.5 Configure schedule	135
5.2.1.6 Configure notifications	137
5.2.1.7 Review details	138
5.2.2 View the status of all backup policies	139
5.2.3 View status of a specific backup policy	141
5.3 Log shipping policies	146
5.3.1 Create a log shipping policy	147
5.3.1.1 Name the log shipping policy	148
5.3.1.2 Select the primary database	149
5.3.1.3 Select location for log shipping	151
5.3.1.4 Select secondary databases	153
5.3.1.4.1 Configure secondary options	154
5.3.1.5 Configure notifications for log shipping	156
5.3.1.6 Review details for log shipping	157
5.3.2 View status of all log shipping policies	158
5.3.3 View status of a specific log shipping policy	160
5.4 Restore policies	163

5.4.1 Create a restore policy	164
5.4.1.1 Name the restore policy	165
5.4.1.2 Select the database you want to restore	166
5.4.1.3 Select the target database	167
5.4.1.4 Configure notifications for restore policy	168
5.4.1.5 Review details for restore policy	169
5.4.2 View status of all restore policies	170
5.4.3 View status of a specific restore policy	172
5.5 View last operation status	176
6. Perform a Manual Backup	177
6.1 Select databases for manual backup	179
6.2 Select backup type	180
6.3 Select location for manual backup	181
6.4 Configure options for manual backup	184
6.5 Configure notifications for manual backup	187
6.6 Review details for manual backup	188
7. Perform a Manual Restore	190
7.1 How InstantRestore works	192
7.2 Select target instance for restore	199
7.3 Select the databases you want to restore	200
7.4 Select the backup set for the restore	201
7.5 Specify a file name and location	204
7.6 Select recovery state	206
7.7 Select restore type	207
7.8 Configure notifications for manual restore	208
7.9 Review details for manual restore	209
8. Report on Backup and Restore Operations	211
8.1 Available reports	212
8.2 Customize reports	214
8.3 How reports work	215
8.4 How to run reports	216
8.5 Deploy reports	217
8.5.1 Install reports	218
8.5.2 Change the report data source	219
8.5.3 Reports permissions and requirements	220
8.5.4 Reports requirements	221
9. Integrate SQL Safe with TSM	222
9.1 How SQL Safe works with TSM	223
9.2 How TSM data retention works	224
9.3 Back up to the TSM Server	226
9.4 Restore a backup from a TSM Server	228
9.5 Automate backups to your TSM Server	229
9.6 Browse archives on the TSM Server	230
9.7 Extract archives from the TSM Server	231
9.8 Mark SQL Safe backup files inactive	232
10. SafeToSQL Utility	233

12.12.4 Manage License Keys	301
13. Viewing SQL Safe on the Idera dashboard	302

14. Navigate the Idera Dashboard	303
14.1 Managing users in the Idera Dashboard	305
14.2 Managing Instances in the Idera Dashboard	307
14.3 Managing products in the Idera Dashboard	308
14.4 Configure navigation order in the Idera Dashboard	309
14.5 Configure Idera Dashboard views	310

SQL Safe Release notes

Idera SQL Safe provides a high-performance backup and recovery solution for Microsoft SQL Server. SQL Safe saves money by reducing database backup time by up to 50% over native backups and reducing backup disk space requirements by up to 95%. SQL Safe also enables complete 'hands-free' automated backup of your entire SQL Server infrastructure and ensures compliance with your organization's backup and recovery policies. From implementations with tens of SQL servers to enterprises with hundreds of servers spread around the globe, SQL safe is the only SQL Server backup and recovery solution that scales to meet the challenge.

To get a quick glimpse into the newest features, fixed issues, and known issues in this release of SQL Safe, review the following sections of the Release Notes:

- [New features and fixed issues](#)
- [Review issues fixed by this release](#)
- [Previous features and fixed issues](#)
- [Known issues](#)
- [See list of recommended Idera solutions](#)

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

New features and fixed issues

SQL Safe provides the following new features and fixed issues.

8.0 New Features

Web Console Application

Besides the desktop application, a new Web Application Console has been included that allows users to monitor their registered SQL Server instances and their respective SQL Safe operations. The web console provides most of the same capabilities as the desktop application. Actions such as adding new SQL Server instances, backing up, restoring, or performing other operations depend on the role assigned to the respective user.

The main features of this Web Console Application are:

- Home tab - with a general status of the environment through alerts, summary information of SQL Safe operations, managed instances, and other important data.
- Policies tab - with information about all SQL Safe policies existing in the users environment.
- Operations History tab - with of all SQL Safe operations performed in the users environment and their current status.
- Instances tab - with a general view of all SQL Server instances registered in the users environment.
- Databases tab - with general information of the databases that belong to the SQL Server instances registered in the users environment.
- SQL Safe Agents tab - provides information of all computers that host registered SQL Server instances and the details of related Safe Agents.

Integration with the Idera Dashboard

Version 2.0 allows you to register as many instances of your SQL Safe with your chosen Idera Dashboard. The **Idera Dashboard** provides a platform of services that allow an integrated user experience across multiple Idera products.

User level permissions

SQL Safe Web Application now allows to assign three different roles to users: Administrator, User, and Guest. Each role has its own specific capabilities and/or restrictions.

Support for EMC Data

SQL Safe now backs up and restores to/from EMC Data Domain.

7.4 New features

Support for SQL Server 2014

Idera SQL Safe 7.4 now supports SQL Server 2014

Support for SQL Server Express

Idera SQL Safe now supports SQL Server Express in all its editions and versions.

Availability to use the SQL Safe Backup Agent to schedule policies

Users can now choose between using the SQL Safe Backup Agent for scheduling backup, restore, and log shipping policies or the SQL Server Agent as another option for scheduling these policies. Previous versions only allowed to use the SQL Server Agent to schedule policy jobs but now the user can choose the SQL Safe Backup Agent as a scheduler for these jobs too.

Centralized license management in the Management Service

License Management has now been centralized in the SQL Safe the Management Service which is in charge of keeping track of those SQL Server instances that are licensed for backup operations. The user specifies which instances they want to license through the License Management view in the Management Console and the Management Service will contact the respective Backup Agents for licensing.

The new License Management view allows users to add multi-instance license keys with no expiration date. On this view users can see which instances are licensed and which ones are only registered but not licensed yet. Users can manage licenses on this view and select those instances that they need to be licensed.

New Upgrade Installer

Users can now access upgrade production installers from our [Customer Support Portal](#). These installers are different from the trial installer, which now generates a trial license for unlimited instances with a 14-day expiration key on a fresh install.

Support on Always On Availability Groups

SQL Safe now supports SQL Server Availability Groups and allows you to perform backup and recovery strategies on your primary and secondary replicas.

7.4 Fixed issues

You no longer need to restart the InstantRestore service when adding a new drive to a server.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Previous features and fixed issues

This build includes many fixed issues, including the following updates.

7.2.1 New features

Improved backup performance

SQL Safe now offers faster backup times when backing up SQL Server instances in the following types of environments:

- When the instance is hosted on server computer that is experiencing heavy resource loads.
- When the instance is running on a virtual machine (VM)

7.2.1 Fixed issues

- SQL Safe now ensures backup jobs do not fail when the SQL Safe Backup Agent cannot read the registry on the target SQL Server instance.
- SQL Safe now provides more stability and better performance when using the Management Console.
- SQL Safe now displays the correct file locations for mirrored and striped backup sets in the following windows:
 - View Policy Settings
 - Summary tab of Backup Policy wizard
- SQL Safe now handles NULL values that may be returned from the operating system when an InstantRestore is in progress, allowing the operation to continue.

7.2 New features

New ability to specify mirror backup locations for Log Shipping policies

You can now store mirrored copies of transaction log backup files in multiple locations, and then select which location should be used as the backup source when the log is shipped. This setting can be configured for each secondary server in the Log Shipping policy.

7.2 Fixed issues

- The SQL Safe Management Console now displays the correct database name when you attempt to cancel an operation and the operation status grid has been sorted by a column other than Start Date.
- When a server is reinitialized for a Log Shipping Policy, the Management Console now correctly refreshes, and no longer returns the error "System.InvalidOperationException: Collection was modified; enumeration operation may not execute."
- SQL Safe now retries failed restore operations associated with Log Shipping policies.
- The SQL Safe Backup Agent now incurs minimal performance impacts when running backup operations on servers that have heavy loads.

7.1 New features

Enhanced Log Shipping Policy features

Log shipping policy enhancements provide a way to specify an alternate network path from where you want the secondary database to pull the file to restore. For additional information about the new log shipping policy features, see [Configure Secondary Options window](#) of the

Log Shipping Policy wizard.

Enhanced Restore wizard features

Restore wizard enhancements provide an easier way to restore from a mirrored database when the primary database location is unavailable. For more information about the Restore wizard enhancements, see [Backup Sets tab of the Restore Wizard](#).

Enhanced Cluster support

SQL safe now supports failovers for Instant Restore during hydration. For additional information about the using SQL Safe in a clustered environment, see [Using SQL Safe on a Microsoft Windows cluster environment](#).

SQL Server 2012 experimental support

SQL Safe 7.1 is SQL Server 2012 RC0 compatible. This version of SQL Safe is not certified against newer builds of SQL Server and should not be used with these builds in a production environment. Idera provides experimental support while you use your installation in a testing environment to ensure the features you rely on most are working as or better than expected.

7.1 Fixed issues

- Users who have a case-sensitive SQL Server user name no longer finds SQL Safe failing to create a job. This issue was the result of SQL Safe adding the characters in an all lowercase format.
- SQL Safe now prompts for a user name and password if a user runs the SQL SafeCmd DELETE command when they do not have access to the remote file system.
- This release fixes an issue that caused some users attempting to upgrade to SQL Safe 7.0 to receive a message stating that a previous version already exists.
- An issue preventing the backup service from starting after some users upgraded to SQL Safe 7.0 is resolved.
- Restore policies no longer become out of sync with the database for users who have multiple data files.
- An issue occurring during an upgrade that prevented backups from starting is resolved. In the job history, this issue logged an error stating, "The process could not be created for step 1 of job X (reason: The system cannot find the file specified). The step failed."
- A data format issue that caused some users to see a number of their policies as "Not Loaded" is fixed. All policies should successfully appear after any SQL Safe version upgrade.
- SQL Safe now prompts the user to sync policies after changing SQL authentication details for a SQL Server.

7.0.2 Fixed issues

- SQL Safe applications and services no longer experience a long delay when starting if Windows cannot verify the Authenticode signature on the associated applications and services.
- SQL Safe Agent deployment no longer fails due to an issue that occurs when accessing the registry on the remote machine during installation.
- The SQL Safe Management Console now properly handles creating and re-initializing log shipping databases that include several data files.
- The SQL Safe Management Console now properly handles creating restore policies for

databases that include several data files.

7.0.1 Fixed issues

- The SQL Safe Today page now accurately displays the status for each item on the policy list and includes the status for operations that occasionally did not appear because the UTC offset was set to hours instead of minutes.

7.0 New features

Access your database quickly during a restore

SQL Safe gives you the option to bring your database back online quickly when performing a restore. The [InstantRestore feature](#) lets you work on restoring a database while allowing users to perform read and write operations to the database during this process. InstantRestore is available only for restoring full databases and does not support a restore of individual files or file groups.

Automatically run a Full backup prior to a Diff/Log backup

SQL Safe simplifies the initial setup process by automatically detecting and performing a Full backup prior to a Differential or Transaction Log backup.

7.0 Fixed issues

- The **Retry reading backup files after network errors** check box on the Backup Sets tab of the SQL Safe Database Restore wizard is renamed **Enable network resiliency**. The functionality remains the same while the name of the field was changed to improve usability.
- The **Verify (checks integrity, no data restored)** option moved from the Recovery State tab to the Target tab in the SQL Safe Database Restore wizard.
- SQL Safe now properly displays the selection in the **Select backup sets manually** box when the user switches from one database to another using the Restore wizard. This issue affected users attempting to restore multiple databases.
- New rolling logs improve troubleshooting by avoiding issues that result when a single log file continues to store information and grows without a limit. This file can cause performance issues and be hard to search for clues to find the issue you are trying to resolve. This feature is recommended for use only when instructed by Idera support.
- SQL Safe Reporting no longer displays an error message when a user attempts to run the Last Backup report.
- Dependent SQL Safe operations in a series are now associated so that when one of the operations fails, all of the following operations are canceled.
- The Restore wizard now properly handles the LSN chain when there is an intermediate Full backup.
- Performance updates improve the speed of the SQL Safe installation.
- Enhancements to SQL Safe memory usage decrease the chance of memory leaks or fragmentation.
- Users can now backup a database using only one thread as specified in the Thread Count field on the SQL Safe Backup Policy wizard Options tab.
- SQL Safe alerting now properly handles log shipping restore schedule start times when set to a non-default value.
- SQL Safe network retry updates fixed an issue that resulted when the SQLAgent job hung

during a backup and the network retry function is disabled.

- SQL Safe no longer causes an extreme load on the tempdb while backing up a database.
- SQL Safe now properly handles FQDN names when connecting to the Backup Service.
- SQL Safe no longer truncates text within the **Result Text** field.
- Users can now sort the list of databases in the SQL Safe Backup wizard by clicking the appropriate column name.
- SafeToSQL users who submit an encryption password that fails verification now receive the correct error message.
- The Backup Policy wizard no longer re-runs the file access check after a user edits the policy unless the change was made to the Location tab.
- SQL Safe now allows encryption passwords of more than 24 characters. This update allows users to implement pass phrases as a more effective method of security.
- Users no longer experience an issue causing the default SQL Server instance file path to change when re-running a failed or skipped backup.
- SQL Safe now features **Cancel** buttons in a number of areas available when the user runs a task. You can cancel a task when performing log shipping re-initialization, deleting a policy, enabling or disabling a policy, running a job, re-synching a policy, or updating a license.
- SQL Safe now prompts the user immediately after a user account credential check fails.
- Improved Command-line Interface (CLI) documentation regarding SQL Safe and TSM server is located in the SQL Safe Help topic, [Back up to the TSM Server](#).
- Accessing sample Command-line Interface (CLI) and Extended Stored Procedure (XSP) script sample access is now documented in the [Product components and architecture](#)
- Users who submit a script that contains unnecessary backslash characters in the file path no longer receive an error message stating, "Value cannot be null." SQL Safe now omits the unnecessary backslash characters and continues the operation.
- Users can now create and run log shipping or restore policies on a database that contains multiple files on different drives.
- The SQL Safe Management Console now contains the proper certificate so the user no longer receives a request for credentials each time they launch the Console. This issue affected Windows 2008 users relying on user account control functionality.
- The default **Connection Settings** detail on the SQL Safe Backup wizard Locations tab no longer retains any changes made during previous use.
- Users can now quickly find an instance in the SQL Safe Database Restore wizard Databases tab by typing the name directly into the instance field and selecting the appropriate instance when it appears.
- Users can now successfully change the IP address on the server hosting the SQL Safe Management Service without causing IP address resolution issues with the Backup Agent.
- Users attempting to restore an older, inactive backup file stored to a TSM server no longer receive an error message.
- SQL Safe XSP now correctly handles wide-character Unicode file names.
- Updated file access permissions fixed a performance issue caused when SQL Safe ran the Backup Policy File Access Check on every database within a SQL Server instance.
- SQL Safe performance is improved when a user attempts to create or run a policy, or load the policy status pages.
- Users with large SQL Safe repositories no longer encounter a timeout when accessing the Backup Sets page in the Management Console during a restore.
- If a backup policy specifies both a FULL as well as DIFF or LOG backups to be performed,

the FULL backup is automatically run for new databases that have no previously-performed FULL backup existing at the time the FULL, DILL, or LOG backup is scheduled, whichever occurs first.

- The SQL Safe Management Console no longer prevents users from deleting some policies. These policies failed when loading from the Repository before the user attempted to delete the policy.
- PDF files of the SQL Safe Help and SQL Safe Release Notes now include hot links to access related information within the document.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Known issues

Idera strives to ensure our products provide quality solutions for your SQL Server needs. The following known issues are described in this section. ***If you need further assistance with any issue***, please contact [Support \(www.idera.com/support\)](http://www.idera.com/support).

Known issues for 8.0

- After registration, SQL Safe Web Console will list all available instances in your repository. Users have to use the options to [Bulk Edit credentials](#) to change credentials for those instances they are not able to monitor.
- Users should take into account that time fields for the Policies, Operation History, and Databases tabs in the SQL Safe Web Console are currently expressed in the GMT time zone.
- The Progress bar of the Operation History tab in the SQL Safe Web Console does not update its progress during the operation execution.
- When uninstalling SQL Safe, users may need to reboot their computers to remove the SQLvdb Filter Service.
- The SQL Safe Web Console is not currently sending e-mail notifications for Restore Operations.
- When uninstalling SQL Safe, users should manually remove the product from their Idera Dashboard before rebooting their system.
- The Collection Service is set to run as Local System by default. Users should ensure this account has sysadmin rights in the SQL Server instance hosting the repository.
- Users who plan to install Safe 8.0 on the same system as VDB should obtain the VDB 2.1 buddy drop which addresses compatibility issues between the two products. Please contact [Idera Support](#) for more information.
- After installing SQL Safe, existing virtual databases may not be accessible. Idera recommends to first upgrade with the VDB 2.1 buddy drop, unmount virtual databases, install SQL Safe, and then recreate the respective VDBs. Contact [Idera Support](#) for more information.

Known issues for 7.4

- When a backup operation in SQL Safe is performed at the same time as the native SQL Server, the successful backup job on SQL Safe may not always show the correct timestamp in the file name of the repository
- When upgrading from an older version, the user may experience Log Shipping policies with an "out of date" message in the console. Clicking the "out of date" link will fix this issue.
- Instead of being assigned the default location set in Preferences, users may find that location paths of stripped files are the same as that of the mirror paths when changing from single to stripped location type.
- Users may find that pressing the "Enter" key in the Backup, Restore and Log Shipping wizards may lead them to the consecutive pages instead of inserting new lines in fields as it is done in the Backup Policy Wizard.
- When setting up a log shipping wizard with a cluster instance, users may find that secondary database file location does not display the same path as the one configured in the respective wizard but it displays the location from the primary database.

- Users may get a Last operation status of "Backups did not start as scheduled" in policies that are configured to run full and differential backups at specific times and where backups are done with no compression and no encryption.
- When running Instant Restore, users may experience problems if they have the same drive mounted as a drive letter and as a folder and they are using both paths for the Instant Restore procedure: the backup file accessed via the drive letter and the data files accessed via the folder path.
- Users may experience timeouts with the Instant Restore processes over a SQL Server 2012 SP1 with cumulative updates.
- Users may find that when the InstantRestore process is running in a clustered SQL Server and a failover occurs during the Hydration process, the Management Console displays the InstantRestore and Hydration processes as halted. The operation will not complete until the cluster is failed back to the original node where the operation was started.
- Users that select the SQL Safe Backup Agent to create policies on servers where the timezone has been changed may need to restart the SQL Safe Backup Agent service to update the timezone and ensure policies run on the correct schedules.

Previous known issues

SQL Safe Repository no longer supports SQL Server 2000

SQL Safe Repository no longer supports SQL Server 2000. Supported versions include:

- SQL Server 2008 R2
- SQL Server 2008 Standard and Enterprise Editions
- SQL Server 2005 Standard and Enterprise Editions SP1 or later

SQL Safe no longer supports Itanium

SQL Safe 7.0 and later does not support the Itanium processor architecture. For more information, see the [software requirements](#).

Pentium II processors are not supported

You should not install SQL Safe on a computer running a Pentium II processor. For more information, see the [hardware requirements](#).

User must select the SQL Server hosting the Repository when using the Maintenance wizard

Users of the SQL Safe Maintenance wizard to modify, repair, or remove this version of SQL Safe must click **Browse** to select the current SQL Server hosting the Repository in the SQL Safe Repository window of the wizard. The wizard does not let you continue until an entry appears in the **SQL Server hosting the Repository** field.

Backup file names that use the %timestamp% macro may change when upgrading to SQL Safe 6.5 or later

When some users upgrade to SQL Safe 6.5 or later, the backup file names using the %timestamp% macro may change. This issue affects users who have SQL Safe groom their backup files at backup time, using either the `-delete` command line option or the **Remove files older than** option in the Backup Policy wizard. Previous versions expand %timestamp% to the UTC time of the backup.

Beginning with SQL Safe 6.5, %timestamp% expands to the local time of the backup. As a result, SQL Safe may write new backups to files already created by an earlier version of SQL Safe immediately after upgrading. By default, SQL Safe appends to backup files and this issue does not occur as the new backup appends to the existing file. This situation resolves itself after the time difference between UTC and local time passes. For example, this issue is resolved after five hours in the Central Standard Time zone (US).

Note that if you specify to overwrite, SQL Safe overwrites the existing files instead of appending the new information. If you upgrade from a release earlier than SQL Safe 6.4, appends fail and display an error message.

Setup program removes previous version when upgrade fails

If the upgrade fails while you are upgrading from a previous version of SQL Safe, the setup program removes the previous version from the SQL Server computer on which you attempted the upgrade.

XSP installation fails on clustered SQL Server instances

When you use the Agent Only install to manually deploy the SQL Safe Backup Agent to a clustered SQL Server instance, the corresponding SQL Safe XSP installation will fail. After the Backup Agent install completes, you can manually install the SQL Safe XSP.

For more information, see the Using the SQL Safe XSP Technical Solution located in the Documentation folder (by default, C:\Program Files\Idera\SQL Safe\Documentation).

Remote Backup Agent install fails when SQL Server is not installed

In order to install the SQL Safe Backup Agent remotely, the computer from which you install SQL Safe must have a version of SQL Server already installed. For more information, see the [software requirements](#).

Table Restore wizard is no longer available in SQL Safe version 6.0 or later

To restore objects and data from your backup files, use the new Idera SQL virtual database tool. For more information, see [Recover objects using SQL virtual database](#).

FIPS-compliant encryption no longer requires additional software when installing SQL Safe version 6.0 or later

In a FIPS-compliant environment, SQL Safe uses only FIPS-compliant algorithms to encrypt your backup files. These encryption methods do not require any additional software. For more information, see [Ensure FIPS compliance](#).

Upgrade any Backup Agents that perform TSM backups

Due to the extensive TSM enhancements included in SQL Safe 6.4 and later, older Backup Agents are not compatible with 6.4. To ensure you can continue backing up your SQL Server data to TSM, upgrade any Backup Agent that is used to perform TSM backups in your environment.

64-bit users need additional steps to install reports

Users with 64-bit installations must follow different steps to install reports. For more

information, see Idera solution 3891, "Where do I find the SQL Safe reports," in the knowledge base on [Support \(www.idera.com/support\)](http://www.idera.com/support).

SQL Safe 4.0 users who upgrade to SQL Safe 7.1 or newer cannot use existing backup policies as part of new restore policies

SQL Safe 4.0 users who upgrade to SQL Safe 7.1 or newer receive error messages if they attempt to create and then run a restore policy that includes a backup policy created on the earlier version of SQL Safe.

SQL Safe Management Service logging multiple grooming events per day

Some users may notice the SQL Safe Management Service logging multiple grooming events in the Windows Application log each day. SQL Safe should be logging only one such event per day.

Attempting to restore a database from the list of backups on the SQL Server details page fails

A failure results when you attempt to restore a database file by right-clicking a file backup in the Backup/Restore Operation Status list and select **Restore Database**. To avoid this issue when restoring a file backup, click **Restore > Database Files** from the menu and complete the available restore wizard. You can also access the wizard from the Servers tree by right-clicking the appropriate SQL Server instance and selecting **Restore Database(s) Files**.

InstantRestore performance is affected by whether the SE_MANAGE_VOLUME_NAME privilege is on your SQL Server

Enabling the SE_MANAGE_VOLUME_NAME privilege for your SQL Server account improves general SQL Server file I/O performance as well as SQL Safe InstantRestore. If this privilege is not enabled for the SQL Server Service, InstantRestore performance could be negatively impacted, just as with SQL Server itself. The degree of impact varies depending on environmental conditions. For more information about SQL Server Instant File Initialization, see the Microsoft Knowledge Base article located at [Database Instant File Initialization](#).

InstantRestore appears to stall when restoring databases that contain read-only file groups

SQL Safe 7.0 Beta hydration appears to stall at 99% complete when restoring databases that contain read-only file groups. SQL Server triggers InstantRestore hydration when it performs read/write I/O on the database files. Because SQL Server does not perform read/write I/O on the read-only files, hydration does not begin. Eventually, hydration begins when SQL Server performs read I/O on the files. You can delete the database if you experience this issue.

Adding a new drive requires you to restart the InstantRestore Service

When you add a new drive to a server, you must restart the SQL Safe Filter Service to make sure that the SQL Safe Filter driver is attached to the new drive. When the SQL Safe Filter Service starts, it attaches the SQL Safe Filter driver to all the fixed drives on the server. If you add a new drive after the service starts, the driver is not attached and any files created on this drive during InstantRestore do not function correctly. To avoid this issue, simply restart the SQL Safe Filter Service after adding any new drive.

Not all files are removed when you delete a database restored using InstantRestore

Some files may remain after you attempt to delete a database previously restored using the InstantRestore feature. In most cases, you can manually delete these mdf, ndf, ldf, and vbm files. If the files are locked, restart either the SQL Safe Filter Service or the SQL Server Instance and then delete the files manually.

Offline SQL Safe Web Help may display a blank page

Some users experience a blank page when pressing F1 and using the offline SQL Safe Help. If this issue occurs, access the online version of SQL Safe 7.1 Help at [http://www.idera.com/help/SQL Safe/7-1/web/default.htm](http://www.idera.com/help/SQL%20Safe/7-1/web/default.htm).

SQL Safe Backup Agent may stop unexpectedly

The SQL Safe Backup Agent may stop unexpectedly and SQL Safe displays an error similar to, ".NET Runtime version 2.0...-Fatal Execution Engine Error." Microsoft recommends that users make sure that their environments include the following patches:

- Windows 2003: [MS11-044: Description of the security update for the .NET Framework 3.5 Service Pack 1 and .NET Framework 2.0 Service Pack 2 on Windows XP Service Pack 3 and on Windows Server 2003 Service Pack 2: June 14, 2011](#)
- Windows 2008 R2/Windows 7: [MS11-044: Description of the security update for the .NET Framework 3.5.1 on Windows 7 Service Pack 1 and on Windows Server 2008 R2 Service Pack 1: June 14, 2011](#)

Importing backup archive sets may result in an error

SQL Safe may experience an issue when you attempt to import backup archive sets into your Repository.

Logins data archived only on Full backups

SQL Safe archives Logins data only when you perform a Full backup. SQL Safe does not archive this data when you perform a Differential or Log backup. You can restore Logins data only when you use a single backup set. When you specify multiple backup sets such as Full, Differential, and Log, you cannot restore Logins data.

Policy views may be blank after upgrading to version 6.6

The new granular alert notifications available in version 6.6 provide more detailed feedback about policy compliance and status. Because policy jobs created with SQL Safe 6.4 or earlier do not support this feature, the Management Console policy views will not display compliance status related to previous backup or restore operations. Instead, the policy views will track the policy status from the time you upgraded. To see the status of previous backup and restore operations, use the [backup/restore operation status pane](#) on the instance and database status views.

No Restore Policy support for backup files stored on TSM Servers

The SQL Safe 6.6 Restore Policy does not support restoring a database from a backup file stored on a TSM Server.

Metadata for SQL virtual database is not generated

SQL Safe is unable to generate SQL virtual database metadata for backups that use the following options:

- SQL Server 2008 databases that use FILESTREAM to manage unstructured data
- Read-write file groups
- File backups

Errors occurring when saving changes may delete policies

If an error occurs while saving changes to an existing policy, the policy may be deleted.

InstantRestore appears to stall when restoring databases that contain read-only file groups

SQL Safe 7.0 Beta hydration appears to stall at 99% complete when restoring databases that contain read-only file groups. SQL Server triggers InstantRestore hydration when it performs read/write I/O on the database files. Because SQL Server does not perform read/write I/O on the read-only files, hydration does not begin. Eventually, hydration begins when SQL Server performs read I/O on the files. You can delete the database if you experience this issue.

Adding a new drive requires you to restart the InstantRestore Service

When you add a new drive to a server, you must restart the SQL Safe Filter Service to make sure that the SQL Safe Filter driver is attached to the new drive. When the SQL Safe Filter Service starts, it attaches the SQL Safe Filter driver to all the fixed drives on the server. If you add a new drive after the service starts, the driver is not attached and any files created on this drive during InstantRestore do not function correctly. To avoid this issue, simply restart the SQL Safe Filter Service after adding any new drive.

Not all files are removed when you delete a database restored using InstantRestore

Some files may remain after you attempt to delete a database previously restored using the InstantRestore feature. In most cases, you can manually delete these mdf, ndf, ldf, and vbm files. If the files are locked, restart either the SQL Safe Filter Service or the SQL Server Instance and then delete the files manually.

InstantRestore Hydration statistics are incorrect if the IR Server restarts during Hydration

During the Hydration phase of the InstantRestore feature, if the IR filter service is restarted, the statistics incorrectly show the hydration process reset to zero. This is not accurate as hydration correctly picks up where it left off in the process.

What is SQL Safe?

Idera SQL Safe (SQL Safe) provides a high-performance backup and recovery solution for Microsoft SQL Server. SQL Safe saves money by reducing database backup times by up to 50% over native backups and reducing backup disk space requirements by up to 95%. SQL Safe also enables complete "hands-free" automated backups of your entire SQL Server infrastructure and ensures compliance with your organization's backup and recovery policies. From implementations with tens of SQL Servers to enterprises with hundreds of instances spread around the globe, SQL Safe is the only SQL Server backup and recovery solution that scales to meet the challenge.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How does SQL Safe help me?

In many organizations today, SQL Server databases are the repositories for large volumes of business-critical data. As database size grows, the time required to back up your data using native tools can easily exceed your maintenance windows, plus a huge amount of storage space is needed for the files. Restore operations also become time-consuming. DBAs need a powerful backup and recovery solution that greatly reduces backup and recovery time, minimizes storage requirements, and provides enterprise management capabilities to conduct backups across a large numbers of servers simultaneously. SQL Safe has been specifically designed to meet these requirements, resulting in increased application and business availability for your critical SQL Server infrastructure.

As a state-of-the-art backup and recovery solution, SQL Safe provides:

- Maximum backup file compression
- Minimum backup times
- Reduced failures due to network glitches
- Accelerated mean time to restore
- Ensured compliance with corporate backup policies

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

How to use the Help

The Idera wiki includes a comprehensive online Help system as well as additional resources that support you as you install and use Idera products. You can also search multiple Idera support solutions, available at www.idera.com/support/faq.

Additionally, Idera helps you by providing:

- 24/7 technical support for critical issues.
- Availability to report cases and access a web-based customer portal for update status.
- Access to our [Knowledge Center](#) where you can find FAQs, How To's, Best Practices, and Webcasts.

This wiki includes the following Web browser minimum requirements:

- Internet Explorer 8.0
- Mozilla Firefox 4
- Google Chrome 6

You can access the Idera SQL Safe Help system through the **Help** icon on the top right section of your window or by pressing F1 on the section where you need more information.

You can print a help topic from the wiki using the Print function in your browser.

Definition of terms

The following terms are used in the product and throughout the documentation.

Application Feature

SQL Safe performs tasks and displays information depending on the Application Feature you have selected. You can change the application feature by clicking a button in the navigation pane on the Management Console. SQL Safe Today, an additional feature, can be reached by clicking the globe icon on the menu bar, or through the View menu.

Backup Agent

The Backup Agent is a service that runs on each of the SQL Server instances hosting databases you want to backup and restore. Before you can deploy a Backup Agent to a SQL Server instance, you must [register the SQL Server instance](#) with SQL Safe.

Operation

An Operation is a work item that can be scheduled to be performed by the Backup Agent. Backups and restores are executed as operations.

Policy

A policy consists of a list of databases, a set of operations to be performed on those databases, and a set of schedules according to which the operations will be performed. Policies allow you to define a maintenance plan across multiple SQL Server instances, which can reside on one or more physical servers. You can then use the Management Console to monitor the status of policies and their associated database backup operations.

Server Groups

Server Groups are collections of similarly tasked SQL Server instances, whose performance and policy status is more easily monitored together. You are not required to place SQL Server instances into groups but, in an enterprise with hundreds of servers, compliance review can be greatly simplified.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Get Started

Use the following checklist to get started using SQL Safe.

<input checked="" type="checkbox"/>	Follow these steps ...
<input type="checkbox"/>	Register the SQL Server instances you want to back up and restore.
<input type="checkbox"/>	Deploy Backup Agents to your registered instances.
<input type="checkbox"/>	<i>If you want to receive alert notifications through e-mail</i> , configure the e-mail settings .
<input type="checkbox"/>	<i>If you want the option to use the InstantRestore feature to restore a database</i> , enable the InstantRestore service .
<input type="checkbox"/>	Determine what your backup and recovery strategy will be.
<input type="checkbox"/>	Determine whether you will perform manual backups of create policies to automate your backups .
<input type="checkbox"/>	Determine which types of compression and encryption are best for your environment.
<input type="checkbox"/>	Determine whether you will use log shipping policies as part of your recovery strategy.
<input type="checkbox"/>	Ensure that you are able to restore the database. You can perform a full backup or you can test your configuration by running a verify-only backup. To perform a verify-only backup, run the Restore Wizard and select the Verify only option on the Recovery tab.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Upgrade to this release

Upgrading SQL Safe allows you to take advantage of the [new features](#) available in this version.

✔ The backup file names using the `%timestamp%` macro may change and cause issues with your backup files. This issue only affects some users. For more information, see the [known issues](#) section of the Release Notes.

✔ SQL Safe includes a file system filter driver to support the InstantRestore feature. The driver, named SQL SafeFilterDriver, allows SQL Server to access database data while SQL Safe is executing InstantRestore. The driver is only used during this action and is no longer in use once the database is completely hydrated.

Upgrade checklist

To successfully upgrade your Microsoft SQL Server environment to this build, complete the procedures outlined in the following table. These procedures support upgrades from SQL Safe versions 5.0 or later.

<input checked="" type="checkbox"/>	Follow these steps
<input type="checkbox"/>	Ensure the computers on which you want to upgrade SQL Safe meet or exceed the product requirements for this version of SQL Safe. For example, ensure .NET Framework 2.0 SP1 or later is running on the target computer.
<input type="checkbox"/>	Ensure your Windows logon account has local administrator permissions on the computers you intend to upgrade.
<input type="checkbox"/>	Review the Product components and architecture .
<input type="checkbox"/>	Review the Supported installation scenarios .
<input type="checkbox"/>	Close all open applications on the computers you intend to upgrade.
<input type="checkbox"/>	Upgrade your SQL Safe installation.

Available upgrade paths

Because each component can be installed separately on different computers, the type of upgrade you will need to perform will depend on your environment. The following table describes the conditions under which you would follow a typical or staged upgrade path.

Environment Description	Recommended Path	Why
-------------------------	------------------	-----

Simple environment, where the Management Console, the Repository, and the Management Service all reside on the same computer	Typical	A simple environment can be upgraded through the setup program.
Distributed environment, where each SQL Safe component resides on a different computer.	Staged	A distributed environment requires a staged upgrade to maintain backup continuity while each component is upgraded.
Multiple Management Consoles deployed to different computers.	Staged	A SQL Safe installation with multiple Management Consoles requires a staged upgrade in order to maintain connection with all Backup Agents while each component is upgraded.
Backup Agents from different SQL Safe versions.	Staged	An environment that manages Backup Agents from different SQL Safe versions requires a staged upgrade in order to maintain connection with all Backup Agents while each component is upgraded.
Change control policies that require multi-phased upgrades.	Staged	An environment with stringent change control policies requires a multi-phased upgrade in order to test each updated component thoroughly before moving on to the next step.

New encryption options in 6.0 and later

SQL Safe 6.0 and later provides new, more secure encryption algorithms. To use these new algorithms, upgrade your Backup Agents to the latest version.

Previous Encryption Options	SQL Safe 6.x Encryption Options
AES	AES-128
DES	AES-256
Triple-DES	
RC2	

These new encryption options replace the options previously available in SQL Safe 5.0 or earlier.

You can select the new encryption options when you manually perform a backup, or create and edit existing Backup Policies.

If you had set encryption options when creating your Backup Policies, the encryption method specified in the corresponding SQL Server job will be automatically updated to AES-128 when you upgrade the associated Backup Agent. You can later change this setting by editing the policy.

SQL Safe 6.0 and later does support previously encrypted archives; you can continue to restore any encrypted backup file created with a previous version of SQL Safe.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Perform a staged upgrade

Use a staged process to upgrade your SQL Safe installation if you have a distributed environment, have deployed multiple Backup Agents that cannot be upgraded during the same time period, or you need to adhere to change control policies.

What is a distributed environment?

A distributed environment consists of the SQL Safe management components running on different physical computers. The management components are:

- Repository database
- Management Service
- Management Console

The time scale over which you choose to perform a staged upgrade will depend on the size of your SQL Server environment and your corporate change control policies. For example, you may choose to perform one of the following steps per day or per week; however, the order in which you perform them should remain the same.

How to perform a staged upgrade

Use this process if your environment meets the following conditions:

- The SQL Safe components are installed on different computers
- All Backup Agents are version 5.0 or earlier

To perform a staged upgrade:

1. Upgrade the Management Service and Repository database to the newest version of SQL Safe by using the setup program to perform a Custom install.
2. Upgrade your Management Console installations to the newest version of SQL Safe. Although you can upgrade the Management Console installations over time, keep in mind that 5.0 and earlier Management Consoles should not be used with 7.x Backup Agents.
3. ***If you use policies to automate your backup and restore operations***, start the SQL Safe Management Console to synchronize the jobs associated with each policy. This synchronization should happen automatically.
4. Upgrade deployed Backup Agents according to your change control policies. As you upgrade your Backup Agents, ensure you use a 7.x Management Console to manage the corresponding instances and Backup Policies.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Perform a typical upgrade

Use the Typical install to upgrade your SQL Safe installation if you have centralized SQL Safe deployment or are upgrading from a trial installation. This process assumes you can upgrade all deployed Backup Agents during the same time period.

What is a typical environment?

In a typical environment, the SQL Safe management components will be installed on the same physical computer. These components include:

- Repository database
- Management Service
- Management Console

Existing backups executed through maintenance plans, SQL Server jobs, or the CLI will continue to run successfully using older Backup Agents. Once you have completed the installation of the management components, you can upgrade your Backup Agents.

How to perform a typical upgrade

A typical upgrade can be easily completed during off-hours.

To perform a typical upgrade:

1. Perform a Typical install to upgrade the management components to the newest version of SQL Safe. When prompted, verify the name of SQL Safe Repository database.
2. ***If you use policies to automate your backup and restore operations***, start the SQL Safe Management Console to synchronize the jobs associated with each policy. This synchronization should happen automatically.
3. Upgrade all previously deployed Backup Agents.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Upgrade deployed Backup Agents

Consider upgrading previously deployed Backup Agents off-hours during a single time period or in stages according to your corporate change policies. You can remotely upgrade previously deployed agents through the SQL Safe Agents view in the Management Console.

-  The Backup Agent is automatically installed on the local computer when you install or upgrade any of the other SQL Safe components.

Backup Agent compatibility with Tivoli Storage Manager (TSM)

SQL Safe 6.4 and later includes extensive enhancements to how SQL Safe handles backing up to and restoring from TSM Server. ***If you store backup files on a TSM Client node***, ensure you upgrade the Backup Agents that perform backups and restores using those files.

Backup Agent compatibility with Backup Policies

SQL Safe 7.x requires version 7.x Backup Agents to successfully run new Backup Policies and edit existing Backup Policies (created with SQL Safe 5.0 or earlier).

If you want to continue using 5.0 or earlier Backup Agents for existing Backup Policies, install SQL Safe 7.x along side your current SQL Safe deployment. Use SQL Safe 7.x to create and manage new Backup Policies, and use SQL Safe 5.0 to maintain existing policies.

Backup Agent compatibility with Log Shipping Policies

Because SQL Safe 5.0 Backup Agents cannot restore backups written by 7.x Backup Agents, environments that include Log Shipping policies require a specific upgrade path. First upgrade the Backup Agents running on the SQL Server computers hosting the secondary databases, and then upgrade the Backup Agents running on the SQL Server computers hosting the primary databases. Otherwise, when SQL Safe attempts to ship a new transaction log backup, the restore operation will fail and the Log Shipping policy status will show that the associated jobs are out of date until all the Backup Agents have been upgraded.

How to upgrade a Backup Agent using the Management Console

This procedure guides you through the process of upgrading previously deployed Backup Agents using the Management Console. You can also manually upgrade a Backup Agent using the setup program.

To upgrade deployed Backup Agents:

1. Verify that your environment includes the newest version of the SQL Safe Management Console.
2. Start the new SQL Safe Management Console, and navigate to the **SQL Safe Agents** view. To access the SQL Safe Agents view, click the **SQL Safe Agents** tab at the bottom of the **Servers** tree.
3. For each Backup Agent you want to upgrade, select the SQL Server computer that is hosting the agent, and then click **Upgrade SQL Safe Backup Agent** on the right-click context menu. You can include the following options to upgrade your agent:
 - Install SQL Safe Agent Extended Stored Procedures
 - Include Backup Service Install Log

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Upgrade the Lite or Freeware Edition

The Management Console detects when a registered SQL Server instance is running SQL Safe Lite or SQL Safe Freeware Edition. You can upgrade the Backup Agent to the current version of SQL Safe enterprise edition using one of the following methods:

- Deploy the current version of the agent. For more information, see [Install SQL Safe Backup Agent](#).
- Select the instance in the Servers tree, and then click **Enable trial license** on the Instance View. This upgrades the license to an enterprise edition trial license.
- Click **Upgrade** on the SQL Safe Agent Properties window. For more information, see [Modify Backup Agent properties](#).

When you upgrade the Backup Agent, SQL Safe deploys the current version of the Backup Agent with a trial license enabled. The trial license allows you full access to the SQL Safe enterprise features for all SQL Server instances hosted on that computer. The trial license is a limited-time, limited-instance license that you will need to upgrade with a production license key.

SQL Safe is a *high-performance backup and recovery solution for your SQL Servers*. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Upgrade the SQL Safe Freeware Edition

SQL Safe Freeware Edition is no longer available. However, you can easily upgrade your SQL Safe Freeware Edition deployment to either SQL Safe or SQL Safe Lite.

Upgrade SQL Safe Freeware Edition to SQL Safe Lite

You can upgrade SQL Safe Freeware Edition to SQL Safe Lite 6.x by running the SQL Safe setup program on the target SQL Server computer and selecting **Agent Only Install**.

The first time you perform a backup using SQL Safe Lite, the tool will generate a trial license. To install and activate your production license, click **Idera > SQL Safe Lite > Activate License** on the **Start** menu.

Upgrade SQL Safe Freeware Edition to SQL Safe

To upgrade from SQL Safe Freeware Edition to SQL Safe 6.x, first perform a full installation of SQL Safe, and then [Upgrade the Lite or Freeware Edition](#) through the Management Console.

If you install SQL Safe on the same computer as your existing SQL Safe Freeware Edition, the corresponding Backup Agent will be automatically upgraded as part of this installation.

After installation, apply your new SQL Safe 6.x production license by clicking **Manage License** on the **Tools** menu in the Management Console.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Deploy the SQL Safe XSP

There are two ways to deploy the SQL Safe XSP: remotely through the Management Console or locally through the command-line interface (CLI).

If you are upgrading a Backup Agent, you will be prompted to perform an upgrade of the XSP for all instances on the target SQL Server.

If you do not want to deploy the XSP to all instances on a given SQL Server, you can deploy the XSP to a single instance through the Management Console or the CLI.

XSP deployment through the Management Console

You can upgrade the XSP when you deploy or upgrade the Backup Agent from the Management Console. At that time, you will be prompted for permission to install or perform an upgrade of the XSP for all instances on the target SQL Server. To install or upgrade the XSP, click **Yes**, and complete the authentication information as necessary. This action will install the new XSP on all instances on the SQL Server.

You can also deploy the XSP to a single instance.

To deploy the SQL Safe XSP to a single instance:

1. In the **Servers** tree, select the instance to which you want to deploy the XSP.
2. On the right-click context menu, click **Install SQL Safe Extended Stored Procedures**.
3. Click **OK**.

XSP deployment using the SQL Safe CLI

If you did not install the XSP during the Backup Agent upgrade, or you want to deploy the XSP to select instances on a given SQL Server, you can install the XSP manually.

To deploy the SQL Safe XSP with the standalone installer:

1. Log on with an administrator account to the SQL Server computer on which you want to install the SQL Safe XSP. Ensure your logon account also belongs to the System Administrators role on each SQL Server instance.
2. Ensure you have the most current version of SQL Safe.
3. Open the Command Prompt, and navigate to the directory where the SQL Safe CLI is installed. By default, the CLI is installed in C:\Program Files\Idera\SQL Safe.
4. Type `SQLsafeCmd InstallXsp -InstanceName MyInstance -Server MyServer Computer`, specifying the name of the instance and the SQL Server computer. For more information about available InstallXSP options, such as specifying authentication credentials, see the CLI Help. To view the CLI Help, type `SQL SafeCmd Help InstallXSP`.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Upgrade SQL Safe in non-trusted domains

SQL Safe 6.4 and later supports seamless integration and communications between trusted and non-trusted domains. ***If you want to take advantage of this feature***, use the following instructions to upgrade your SQL Safe 6.3 or earlier environment.

- ✔ To upgrade SQL Safe 6.4 or later to the current release version, follow the standard [Typical](#) or [Staged](#) upgrade instructions.

How to upgrade a single Repository deployment

This deployment consists of:

- One SQL Safe Repository hosted in the trusted domain
- A Management Service in each non-trusted domain
- A single Management Service that manages SQL Server instances in your trusted domain
- Management Consoles in trusted and non-trusted domains
- Backup Agents in trusted and non-trusted domains

To upgrade this deployment:

1. Uninstall the Management Service from each non-trusted domain.
2. Ensure your Backup Service and Management Service accounts have the [appropriate permissions](#).
3. Ensure the [required ports](#) are open in all trusted and non-trusted domains.
4. Decide how many SQL Safe Management Consoles you need to keep in each domain, and uninstall those consoles you no longer need. Maintaining a Management Console in a non-trusted domain is no longer required.
5. Run the setup program to upgrade:
 - The SQL Safe Repository and Management Service in the trusted domain
 - The Management Consoles in the trusted domain
 - The Management Consoles in the non-trusted domains. Note that this step is optional, depending on whether you decided to maintain these consoles.
6. ***If you use policies to automate your backup and restore operations***, start the SQL Safe Management Console to synchronize the jobs associated with each policy. This synchronization should happen automatically.
7. [Upgrade all deployed Backup Agents](#) in your trusted and non-trusted domains.

How to upgrade an island deployment

This deployment consists of:

- A complete SQL Safe installation in each non-trusted domain
- A single centralized installation that manages SQL Server instances in your trusted domain

To upgrade this deployment:

1. Decide how many SQL Safe Management Consoles you need to keep in each domain. Maintaining a Management Console in a non-trusted domain is no longer required.
2. Identify which domain you want to host your new centralized SQL Safe deployment.
3. Ensure your Backup Service and Management Service accounts have the [appropriate permissions](#).

4. Ensure the [required ports](#) are open in all trusted and non-trusted domains.
5. Uninstall the SQL Safe management components from the domains you do not intend to use to host SQL Safe. Remember to preserve the Management Consoles you identified in Step 1.
6. [Upgrade the SQL Safe management components](#) that were previously deployed to the selected domain.
7. Run the setup program to upgrade all remaining Management Consoles.
8. ***If you use policies to automate your backup and restore operations***, start the SQL Safe Management Console to synchronize the jobs associated with each policy. This synchronization should happen automatically.
9. In each Management Console, verify that:
 - It can connect to the upgraded SQL Safe Repository
 - It is using the [correct Management Service](#)
10. [Upgrade all deployed Backup Agents](#) in your trusted and non-trusted domains.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Product components and architecture

SQL Safe provides a robust, easy-to-use SQL Server database backup and restore solution. Behind a simple user interface, SQL Safe offers an architecture that is both flexible and extremely powerful. SQL Safe fits your environment, no matter how simple or complex.

The SQL Safe architecture easily runs in your SQL Server environment with minimal configuration. All SQL Safe components run outside and separate from SQL Server processes. SQL Safe does not add to or modify any of your native SQL Server files or services. After you install these components, you can implement features such as [Reports](#).

 You must use the same Windows account for the Backup Agent and InstantRestore Service. During installation, you are asked to enter credentials for only one account and the other is created with the same information. If you manually change your account information, make sure you change it in the other service as well to avoid any issues.

Product components

Management Console

The Management Console is a centralized, intuitive user interface that allows you to easily and quickly back up and restore data on specific SQL Server instances.

The Management Console also provides a T-SQL generator, allowing you to create backup and restore T-SQL scripts. You can execute these scripts through scheduled SQL Server jobs or combine several scripts into a single SQL Server scheduled batch job.

Repository Database

The SQL Safe Repository (Repository) is a central database that tracks all SQL Safe backup and restore operations and the corresponding backup archive file paths for your enterprise.

Management Service

The Management Service receives events from the Backup Agent, and then relays the status of all current and completed operations to the SQL Safe Repository.

Backup Agent

The Backup Agent performs backup and restore operations. The agent is a service that runs on the target SQL Server computer.

InstantRestore Service

The InstantRestore Service is used by the Backup Agent to query and change any InstantRestore properties not managed by the Agent. For more information about InstantRestore properties, see [InstantRestore](#).

Command-line Interface and Extended Stored Procedures

The SQL Safe command line interface (CLI) and extended stored procedures (XSPs) allow you to execute SQL Safe backup and restore procedures with batch files or through your preferred scripting language. You can also use the CLI or XSPs as an alternative to the Management Console.

For sample XSP scripts, see the Sample Scripts programs menu shortcut (**Start > All Programs > Idera > SQL Safe > XSP > Sample Scripts**). The following scripts are available:

- xp_ss_backup
- xp_ss_browse
- xp_ss_expire
- xp_ss_extract
- xp_ss_restore
- xp_ss_restorefilelistonly
- xp_ss_restoreheaderonly
- xp_ss_restorelast
- xp_ss_verify

Product architecture

The following diagram illustrates the components of the SQL Safe architecture.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Hardware requirements

SQL Safe requires the following hardware.

Hardware Type	Requirement	Recommendation
CPU	1 GHz	2 GHz
Memory	512 MB	1 GB
Hard Drive Space	80 MB (installation files only)	1 GB (temporary disk space for backup and restore operations as they write data to and from files)
Monitor Resolution	1024 by 768 pixels	1024 by 768 pixels

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Permission requirements

SQL Safe requires specific permissions and rights to successfully execute backup and restore operations. Generally, the rights of the Management Console user dictate the rights available to SQL Safe.

✔ **If you are deploying SQL Safe to a non-trusted domain**, specify an account with sysadmin fixed role rights for the Management Service and Backup Agent Service accounts, and ensure that SQL Authentication is enabled on each SQL Server instance where a SQL Safe component has been installed.

Recommended permissions for trial installations

Type	Requirement
Windows Permissions	Your Windows logon account has local Administrator permissions.
SQL Server Privileges	Your Windows logon account is a member of the sysadmin fixed server role on the SQL Server instance.

Required permissions for production installations

Account	Action	Permissions Required
---------	--------	----------------------

Windows user account	<ul style="list-style-type: none"> • Allows you to install the Backup Agent on local or remote SQL Server instances. • Allows you to install SQL Safe components. • Allows you to perform SQL Safe tasks, such as executing a backup or restore operation, using standard Windows authentication. • Allows you to create the SQL Safe Repository database. • Allows you to read and write backup files. • Allows you to access the SQL Safe Repository. 	<ul style="list-style-type: none"> • Windows administrator permission on the Management Console computer and target database server. • Windows administrator permission on the target computer. • <code>db_owner</code> or <code>db_backup operator</code> role on each user or system database and VIEW SERVER STATE permission on the registered SQL Server instance. • Create Database rights on the target SQL Server instance. • Windows account credentials with read and write permission on the volume of share you want to write or read backup files. • Read and write privileges on the SQL Safe Repository database, execute privileges for stored procedures.
SQL Server login	<ul style="list-style-type: none"> • Allows you to perform SQL Safe tasks, such as executing a backup or restore operation, using standard SQL authentication. • Allows you to create the SQL Safe Repository database. 	<ul style="list-style-type: none"> • <code>db_owner</code> or <code>db_backup operator</code> role in each user or system database and VIEW SERVER STATE permission on the registered SQL Server instance. • Create Database Rights on the target SQL Server instance.

Management Service account	Allows the SQL Safe Management Service to access the SQL Safe Repository database.	db_owner role or the following SQL permissions on the SQL Safe Repository database: <ul style="list-style-type: none"> • EXECUTE • INSERT • SELECT • UPDATE • DELETE
Backup Service account	Allows the Backup Agent to access the SQL Server instances in your environment.	sysadmin privileges on each SQL Server instance.
MSSQLSERVER service	Allows SQL Safe XSP to read and write backup files.	Read and write permission on the volume or share you want to write or read backup files.
TSM Server	Allows you to configure TSM Server and client nodes for communication.	Administrator privileges within TSM Server.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Port requirements

The SQL Safe services use specific ports to communicate to each other as well as other SQL Safe components. Before installing SQL Safe, ensure the following ports are available.

Service	Port for trusted domains	Port for non-trusted domains
Backup Service	5164	5165
Management Service	5162	5163

SQL Safe automatically detects whether its components have been installed in trusted or non-trusted domains.

If your environment requires SQL Safe to use a different port, you can specify a custom port by changing the associated registry key. For more information about how to assign different port numbers, see Idera Solution 204. To confirm which ports to use, or to verify whether a domain is trusted or not, contact your network administrator.

- ✓ When you specify a custom port setting for communications in your trusted domain, SQL Safe automatically assigns the non-trusted port (CustomPort + 1). For example, if the custom port is 6000, the port used for communications in non-trusted domains will be 6001.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Software requirements

The SQL Safe components have the following general software requirements, as well as specific requirements outlined in the following sections. ***If a service pack is not specified***, a service pack is not required for that version of the software.

i SQL Safe supports the built-in clustering technology included with the following versions of Microsoft Windows operating systems:

- Microsoft Windows Server 2003 R2
- Microsoft Windows Server 2003 SP2
- Microsoft Windows Server 2008
- Microsoft Windows Server 2008 R2

General Software Requirements

- Microsoft Data Access Components (MDAC) 2.8 or later
- Microsoft .NET Framework version 2.0 or 3.5. ***If this software is not already installed on your computer***, you must install it prior to the installation of SQL Safe. This software can be installed from the installation kit by clicking **Prerequisites** on the Install window of the setup program. For more information about the .NET Framework, see the [.NET Framework Versions and Dependencies](#) article on MSDN.
- The following Web browser minimum requirements for this Wiki:
 - Internet Explorer 8.0
 - Mozilla Firefox 4
 - Google Chrome 6

Management Console and Management Service

The Management Console and Management Service can run on both 32- and 64-bit computers. Each component requires one of the following operating systems.

- Microsoft Windows Server 2003 SP2
- Microsoft Windows Server 2008 R2
- Microsoft Windows Server 2008 SP1
- Microsoft Windows Server 2012
- Microsoft Windows Server 2012 R2
- Microsoft Windows 2000 SP4 (Excludes InstantRestore feature support)
- Microsoft Windows XP Professional SP3 or later
- Microsoft Windows Vista SP2 or later
- Microsoft Windows 7
- Microsoft Windows 8

Backup Agent

The Backup Agent is supported to run on both 32- and 64-bit computers. The Backup Agent requires one of the following operating systems and one of the following Microsoft SQL Server versions.

- Microsoft Windows Server 2003 SP2
- Microsoft Windows Server 2008 R2
- Microsoft Windows Server 2008 SP1

- Microsoft Windows Server 2012
- Microsoft Windows Server 2012 R2
- Microsoft Windows 2000 SP4 (Excludes InstantRestore feature support)
- Microsoft Windows XP Professional SP3 or later
- Microsoft Windows Vista SP2 or later
- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft SQL Server 2000 SP4
- Microsoft SQL Server 2005 SP1 or later - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2008 - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2008 R2 - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2012 - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2014 - All Editions (Express, Standard, Enterprise, etc.)

SQL Safe Repository

The computer hosting the SQL Safe Repository requires one of the following operating systems and one of the following Microsoft SQL Server versions.

- Microsoft Windows Server 2003 SP2
- Microsoft Windows Server 2008 R2
- Microsoft Windows Server 2008 SP1
- Microsoft Windows Server 2012
- Microsoft Windows Server 2012 R2
- Microsoft Windows 2000 SP4 (Excludes InstantRestore feature support)
- Microsoft Windows XP Professional SP3 or later
- Microsoft Windows Vista SP2 or later
- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft SQL Server 2005 SP1 or later - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2008 - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2008 R2 - All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2012 All Editions (Express, Standard, Enterprise, etc.)
- Microsoft SQL Server 2014 All Editions (Express, Standard, Enterprise, etc.)

InstantRestore

For the InstantRestore feature take into account the following operating systems:

- Microsoft Windows Server 2003 SP2
- Microsoft Windows Server 2008 R2
- Microsoft Windows Server 2008 SP1
- Microsoft Windows Server 2012
- Microsoft Windows Server 2012 R2
- Microsoft Windows XP Professional SP3 or later
- Microsoft Windows Vista SP2 or later
- Microsoft Windows 7

You cannot use the InstantRestore feature on any version of the Microsoft Windows 2000 operating system.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. ***Learn more > >***

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

TSM requirements

SQL Safe supports the following versions of the TSM Client application:

- TSM Client 7.1.x.x
- TSM Client 6.4.x.x
- TSM Client 6.3.x.x
- TSM Client 6.2.x.x
- TSM Client 6.1.x.x
- TSM Client 5.6.x.x
- TSM Client 5.5.x.x
- TSM Client 5.4.x.x

By default, SQL Safe supports any version of the TSM Server to which the supported TSM Client versions can connect. For more information about TSM Server requirements, see your IBM TSM documentation.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Supported installation scenarios

You can install and deploy SQL Safe to meet your unique backup, recovery, and SQL Server environment needs.

Typical environment

The following figure illustrates a typical SQL Safe implementation scenario. This configuration includes the following installations:

- Management Console on your workstation
- Repository and Management Service on a SQL Server instance
- Backup Agents on each computer hosting databases you want to back up and recover

Clustered environment

You can install and configure SQL Safe to back up and recover virtual SQL Servers. A virtual SQL Server is a SQL Server running on a Microsoft failover cluster managed by Microsoft Cluster Services.

This configuration can be limited to deploying the Backup Agent to your virtual instances, or can include a full SQL Safe deployment.

A Backup Agent deployment to a virtual instance includes the following installations:

- Management Console on your workstation
- Repository and Management Service on a SQL Server instance (not located in the cluster)
- Backup Agents on each cluster node hosting the virtual SQL Server you want to manage

For more information, see [Installing backup/restore components in a clustered environment](#).

A full SQL Safe deployment on a cluster includes the following installations:

- Management Service and Backup Agent on each node of the Windows cluster
- Repository on any virtual SQL Server instance
- Management Console on your workstation (can also be installed on the cluster nodes)

For more information, see [Installing management components in a clustered environment](#) and [Installing backup/restore components in a clustered environment](#).

Non-trusted environment

You can install and configure SQL Safe to backup and recover SQL Server databases running in non-trusted domains or workgroups.

This configuration includes the following installations:

- Management Console on your workstation in a trusted or non-trusted domain
- Repository and Management Service on a SQL Server instance in a trusted or non-trusted domain
- Backup Agents on each SQL Server instance you want to manage (server can belong to a trusted or non-trusted domain or workgroup).

✓ When deploying SQL Safe to a non-trusted domain, specify an account with sysadmin fixed role rights for the Management Service and Backup Agent Service accounts, and ensure that SQL Authentication is enabled on each SQL Server instance where a SQL

Safe component has been installed.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How to install SQL Safe

This procedure guides you through a typical install of SQL Safe. A typical install sets up all SQL Safe components on the same computer. Use this procedure for first-time installs and evaluation installs.

Before you begin the installation process, ensure you review:

- [Product components and architecture](#)
- [Hardware, software, permission, and port requirements](#)
- [Supported installation scenarios](#)

✔ You can install each SQL Safe component in domains with or without trust relationships. For example, you can install the Management Service and Repository in a trusted domain and then install the Management Console and Backup Agents in a non-trusted domain.

Start the setup program

You can install SQL Safe on any computer that meets or exceeds the product requirements.

To start installing SQL Safe:

1. Log on with an administrator account to the computer on which you want to install SQL Safe.
2. Close all open applications.
3. Run `Setup.exe` in the root of the installation kit.
4. Click **All components** on the **Install** section of the Welcome window.
5. Click **Run** to proceed with the installation file.
6. On the Welcome wizard window of the setup program, click **Next**.
7. Review and accept the license agreement by clicking **I accept the terms in the license agreement**, and then click **Next**.

Choose where you want to install SQL Safe and who should use the product on this computer

You can use the default install location or specify a different location. For your first install, we recommend using the default location.

To choose a different location:

Click **Change** to navigate to the location you want to use, and then click **Next**.

To restrict access:

Choose whether you want any user or only the current user to access this application, and then click **Next**.

Choose which components you want to install

For your first install, we recommend using the **Typical** setup type. This type ensures you install and configure all required SQL Safe components, so you can immediately begin using SQL Safe in your environment.

Click **Typical**, and then click **Next**.

Choose which SQL Server instance you want to host the Repository database

You can use a SQL Server instance installed locally on this computer or on another computer. For your first install, we recommend using a local instance.

SQL Safe can connect to the selected SQL Server instance using the credentials of your current Windows logon account or a SQL Server login. For your first install, we recommend using your current logon account credentials.

To choose a different instance:

1. Click **Browse** to select the SQL Server instance you want to use. The Select SQL Server window lists all available instances in your current domain and other trusted domains.
2. Click **OK**.
3. Click **Next**.

To specify a SQL Server login:

1. Click **Use Microsoft SQL Server authentication**, and then click **Change**.
2. Specify the credentials of a login with `sysadmin` privileges on that instance, and then click **OK**.
3. Click **Next**.

Choose which Windows user account you want the Management Service to use

For your first install, we recommend using your Local System Account for the Management Service account. SQL Safe uses this service account to communicate between the Backup Agent, the Management Console, and the SQL Safe Repository.

To choose a different account:

1. Determine whether your environment uses Windows or SQL authentication, and then pick a secure account that has the appropriate [permissions](#).
2. **If you use Windows authentication**, click **User Account**, and then provide the appropriate credentials.
3. **If you use SQL authentication**, click **Use Microsoft SQL Server authentication**, provide the appropriate credentials, and then click **OK**.
4. Click **Next**.

Choose the account that SQL Safe uses for the Backup Agent service

Specify the account under which the SQL Safe Backup Agent Service will run. This account runs as a Windows service on the computer hosting the managed SQL Server instances. This service account must have System Administrator access to the SQL Server instance.

Specify if you will use a **User Account** or a **Local System Account**. For your first install, we recommend you use your Local System Account. If you choose to use a User Account, then you must provide the appropriate credentials.

Choose whether you want to install the SQL Safe XSP

You can install the SQL Safe extended stored procedures (SQL Safe XSP) to all local instances when you install SQL Safe. The SQL Safe XSP extends the Backup Agent so you can integrate SQL Safe backup operations with existing T-SQL backup scripts. You can always deploy the SQL Safe XSP at a later time.

To skip this install, click **No**, and then click **Next**.

By default, the setup program uses the credentials of your Windows logon account to create the SQL Safe extended stored procedures. You can enable the option **Using Microsoft SQL Server authentication** and specify the respective credentials of a login with sysadmin privileges on that instance. Click **Next**.

Choose where you want SQL Safe to store backup files

You can use the default backup location or specify a different location. For your first install, we recommend using the default location (C : \Backup).

If you want to save backup files to a different local folder, type the directory path in the **Local Path** field or click **Browse** to search for a specific location, then click **Next**.

If you want to save backup files to a network share, type a valid path (\\server\share) in the **UNC Path** field, and then click **Next**.

Ensure the Backup Agent Service account has read and write access to the specified location.

Complete the install

Indicate that you are ready to complete your install and apply the configurations you specified. After install is complete, you can start the Management Console to immediately begin experiencing the benefits SQL Safe provides.

To complete your install:

1. Click **Install**.
2. Click **Finish**.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Install SQL Safe Backup Agent

You can remotely deploy the SQL Safe Backup Agent from the Management Console to SQL Server instances across your enterprise.

To install a SQL Safe Backup Agent:

1. In the navigation pane, click **SQL Safe Agents**.
2. Right-click on the computer in question in the tree pane.
3. Click **Install SQL Safe Backup Agent** from the context menu.
4. Choose whether you want to install the SQL Safe XSP. You can also enable or disable the option for installing SQL Safe Agent Extended Stored Procedures.
5. Click **OK**.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Deploy the Backup Agent

When deployment is complete, you can back up and recover databases hosted on your virtual instances. You do not need to install any other SQL Safe components on your clustered servers to implement a disaster recovery strategy for those virtual instances. If you have a clustered environment hosting multiple instances, you must manually deploy the SQL Safe Backup Agent on each node.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Using SQL Safe on a Microsoft Windows Cluster environment

SQL Safe is comprised of multiple application components, each providing specific functionality in different areas of the product. These different areas of functionality have specific concerns when deploying in a clustered environment, as redundancy and high availability are an issue. The following table includes the applications and services that SQL Safe is comprised of, with a summary of the requirements of each to be fully fault tolerant using the Microsoft Windows Clustering technology. SQL Safe components can work in either *active-passive* or *active-active* cluster configurations.

Component	Clustering Configuration Considerations
SQL Safe Management Console	None.
SQL Safe Command Line	None.
SQL Safe Management Service	This component is responsible for managing operational and policy status and alerting for your entire SQL Safe deployment. If you require these SQL Safe functions to be fault tolerant, configure this component as a <i>Generic Service Resource</i> on a clustered server. You need to deploy this component only once onto a single cluster, not on each server you are backing up. For more information about installing the SQL Safe Management Service on a Windows cluster, see Installing management components in a clustered environment .
SQL Safe Repository Database	This component is a SQL Server database used to store operational history and policy configuration information. The SQL Safe Repository Database is used by the Management Console to display operational history and by the Management Service to process and send alerts. For this component to be fault-tolerant, simply host the database on a clustered SQL Server.
SQL Safe Backup Service	This component is responsible for executing backup and restore operations on nodes hosting any clustered SQL Servers. You need to install this service only on each node of the cluster. No failover or cluster resource configuration is necessary. You can deploy the agent from the Management Console or the product installer.

SQL Safe Filter Service	<p>This component is responsible for performing instant restore operations on nodes hosting any clustered SQL Servers. If you require that SQL Safe Instant Restore functionality be fault tolerant, configure this component via the SQL Safe Command Line. You should not configure this service as a clustered resource. Instead, a failover mechanism is activated via a <i>Generic Script Resource</i>, and is automatically configured for you using a SQL Safe command. For more information about installing the SQL Safe Filter Service on a Windows cluster, see Installing backup/restore components in a clustered environment.</p>
-------------------------	---

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

---------------	----------	----------	---------	-----------	----------	-----------	-------

Installing management components in a clustered environment

For a fault-tolerant SQL Safe management infrastructure, follow the standard procedure for installing SQL Safe by running the FULL installer on all the cluster nodes you want to host your SQL Safe Management Service, whether active or inactive. For new installations, choose at least the Management Service and Repository Database components. Upgrades automatically choose the correct components for you. To make the repository database clustered, simply specify a clustered SQL Server to host the Repository database.

Before you begin, open the Windows Services application (services.msc) and find the SQL Safe Management Service. Make sure that the **Startup Type** is set to **Manual** and that the service status is **Stopped** in all but the active node. *If you are upgrading your installation*, there are no more requirements. *If you are installing a new deployment*, you must also configure the Management Service as a Generic Service Resource. Select the appropriate task below to perform this action.

Configuring the SQL Safe Management Service as a Generic Service Resource using Windows Server 2003

1. Open the Windows Cluster Administrator application named `cluadmin.exe`.
2. Create or choose a resource group containing defined **IP Address** and **Network Name** resources. Note that the **IP Address** and **Network Name** resources in this group are used to access your SQL Safe Management Service. If you choose to use an existing group, note that fail over for each component in this group occurs together. If you choose to create a new group and resources, make the owners of the new resources the same nodes on which you installed the Management Service. Once you configure or choose a group for the SQL Safe Management Service, you can add the Generic Service Resource using the following steps.
3. Right-click the group, and then select **New > Resource**.
4. On the New Resource window, type a name for the Management Service resource, such as SQL Safe Management Service.
5. Select the **Generic Service** resource type, and then click **Next**.
6. On the Possible Owners window, click **Next**.
7. On the Dependencies window, add the IP address and network name resources by selecting the appropriate address and name, and then clicking **Add >** to move them to the dependencies area.
8. Click **Next**.
9. On the Generic Service Parameters window, type **SQL Safe Management Service** as the service name.
10. Check the **Use Network Name for Computer Name** check box, and then click **Next**.
11. On the Registry Replication window, click **Add**.
12. In the root registry field, type the following text:
Software\Idera\SQL Safe\Management Service
13. Click **OK**.
14. Click **Finish**.
15. Right-click your new Generic Service resource, and then select **Bring Online**. Your SQL Safe Management Service is now configured for cluster failover.
16. Right-click your new Generic Service resource, and then select **Bring Online**. Your SQL Safe Management Service is now configured for cluster failover.

Configuring the SQL Safe Management Service as a Generic Service Resource using Windows Server 2008/ Windows Server 2008 R2

Use the following steps if you **do not** have an existing application or service that you want to use for the SQL Safe Management Service.

1. Open the Windows Failover Cluster Management application named **cluadmin.msc**.
2. Right-click Services and Applications, and then select **Configure a Service or Application**.
3. On the Select Service or Application window, click **Generic Service**, and then click **Next**.
4. On the Select Service window, click **SQL Safe Management Service**, and then click **Next**.
5. On the Client Access Point window, type or select the IP address and network name that you want to use to access the SQL Safe Management Service, and then click **Next**.
6. On the Select Storage window, click **Next**.
7. On the Replicate Registry Settings window, click **Add**.
8. In the root registry field, type the following text:
Software\Idera\SQL Safe\Management Service
9. Click **OK**.
10. Click **Next**.
11. On the Confirmation window, click **Next**. The wizard configures the service as displayed on the Configure High Availability window, and then displays the Summary window.
12. On the Summary window, click **Finish**. Your SQL Safe Management Service is now configured for cluster failover.

Use the following steps if you **do** have an existing application or service, already configured with the IP address and network name that you want to also use for the SQL Safe Management Service.

1. Open the Windows Failover Cluster Management application named **cluadmin.msc**.
2. Right-click the application, and then select **Add a resource > 4 - Generic Service**.
3. On the Select Service window, wait while the services populate the fields with a list of services installed on this computer.
4. Click **SQL Safe Management Service**, and then click **Next**.
5. On the Confirmation window, click **Next**. The wizard configures the service as displayed on the Configure Generic Service window, and then displays the Summary window.
6. On the Summary window, click **Finish**.
7. Right-click your new Generic Service resource, and then select **Properties**. SQL Safe now displays the SQL Safe Management Service Properties window which contains many tabs.
8. On the General tab, check the **Use Network Name for Computer Name** check box.
9. On the Dependencies tab, add the **Network Name** and **IP Address** resources belonging to this application.
10. On the Registry Replication tab, click **Add**.
11. In the root registry field, type the following text:
Software\Idera\SQL Safe\Management Service
12. Click **OK**.
13. On the SQL Safe Management Service Properties window, click **OK**.
14. Right-click your new Generic Service resource, and then select **Bring this resource online**. Your SQL Safe Management Service is now configured for cluster failover.

SQL **safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Installing backup/restore components in a clustered environment

For a fault-tolerant backup and restore infrastructure, you must install the SQL Safe Backup Service and SQL Safe Filter Service on the computers hosting your SQL Servers. Although you are using a clustered environment, **you should not configure these services as clustered resources**. Doing so would compromise their functionality in *active-active* clustering configurations. In the case of InstantRestore, you can perform the optional step of executing a one-time command to enable failover support for SQL Safe hydration operations. See the following topic to enable fault tolerance for IR hydration per SQL Server instance.

Install or upgrade the SQL Safe backup and restore components via the SQL Safe Management Console

1. Install the SQL Safe Management Console onto a computer using the FULL Installer. You can install on any computer, as long as it can access the servers to which you want to deploy the SQL Safe Management Console.
2. Launch the SQL Safe Management Console.
3. Register the clustered SQL Server instances on which you want to install or upgrade SQL Safe by right-clicking **SQL Server Instances**, and then selecting **Register SQL Server**.
4. Right-click the SQL Server instance in the Servers tree, and then select **Install SQL Safe Backup Agent**.
5. Follow the on-screen instructions and finish deploying the Backup Service components.
6. Once this process is complete, click the **SQL Safe Agents** tab. SQL Safe displays the active and inactive node names of the clustered SQL Server onto which you installed the SQL Safe Backup Agent.
7. Right-click the first of the remaining nodes, and then select **Install Backup Agent**. Repeat this step for each of the remaining nodes to install or upgrade the Backup Service components on the remaining nodes.
8. Verify that the **Management Server** column matches the correct management service. This setting is automatically set during your installation or upgrade.
9. **If want to use InstantRestore functionality**, right-click the first node, and then choose **Enable SQL Safe Instant Restore**. Repeat this step for each of the remaining nodes. Your SQL Safe Backup Services are now installed.

Enable fault tolerance for InstantRestore Hydration per SQL Server instance (Optional)

This process is necessary only if you want fault tolerance for databases still going through the hydration process of InstantRestore. Before you begin, make sure that your SQL Safe Backup service components are already installed.

1. Remotely log on to a node of the cluster.
2. Open a new Command Window.
3. For each clustered SQL Server instance hosted on that cluster server, run the following command:

```
SQL SafeCmd Cluster FilterService sqlserver_name
```

Where `sqlserver_name` is the full SQL Server name of the clustered SQL Server.

This command creates a Generic Script Resource that controls failover for Hydration operations for that specific SQL Server. Note that this command is run only once per clustered SQL Server, not per node.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Configure your deployment

After initially installing and setting up SQL Safe, there are several tasks you might want to do in order to further customize and streamline your install. Review the following sections to get a good understanding and make the best of your SQL Safe installation.

SQL **safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure e-mail settings

You can enable SQL Safe to send email notifications about the current status of your backup and restore operations.

Access these settings by clicking **Configure E-mail Notifications** on the **Repository and Management Service Settings** window, accessible from the bar menu (gear icon), or by selecting **E-mail Notification Settings** in the **Tools** menu.

What email settings can I change?

If you enable **E-mail Notifications**, you can configure how the email will appear in your Inbox.

Sender Name

Enter the name that will appear as the sender of the email.

Reply-to Address

Enter the email address that will appear as the sender, and where replies to the message will be sent.

Priority

Select low, normal, or high priority for the email alerts.

What mail server information is required?

You must specify the mail server information so that SQL Safe can send email notifications.

Server Address

Enter the address of your mail server.

Server Port

If you want to specify a port different from 25 (set by default), you can do that in this section. You can also enable SSL encrypted connection.

SMTP Authentication

If your SMTP server requires authentication, you must type a valid **User Name** and **Password** that SQL Safe should use to access to the mail server.

Test your settings

To be sure that your settings are correct, click **Test Settings** on the bottom section of the window, then check the test email sent to your email server.

SQL safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Configure Console preferences

SQL Safe allows you to modify many of the default settings of the application, and you can change your **Management Console Preferences** at any time. To access this option go to the **Tools** Menu and select the respective option. The window for **Management Console Preferences** allows you to modify settings in the following categories:

- Backup
- Agent Deployment
- User Experience
- Policy Data

What Backup settings can I change?

On the **Backup** tab, you can set the default parameters that appear on the **Backup Wizard**. Set the default parameters to the values you typically use. If you want to use different settings on any given backup, you can still make changes on the wizard itself.

The parameters you can set include the following:

- Backup archives location
- Tivoli Storage Manager backup archives location
- Default compression and encryption algorithms
- Generating maps containing metadata for use with InstantRestore and SQL virtual database
- Auto-generated backup file names
- Number of threads employed in a backup

What Agent Deployment settings can I change?

On the **Agent Deployment** tab, you can identify service account used to run the agents. You can also choose whether or not you want to automatically upgrade the Backup Agents and the XSP if you upgrade to a new SQL Safe version.

What User Experience settings can I change?

On the **User Experience** tab, you can:

- Enable automatic refresh on screen and set the number of seconds between each refresh.
- Change display status for server status.
- Set the Total Cost of Ownership parameter necessary to calculate your return on investment.
- Configure troubleshooting settings.

What Policy Data settings can I change?

On the **Policy Data** tab you can define the location of your policy data files.

By default policy data files are stored in the `C:\<InstallPath>\SQL Safe\PolicyData` folder, but you can use this option to specify a different location. Click **Local Path** and browse the folder where you want to store your policy data files or select the respective option for creating a new folder.

By default each agent uses its own installation directory to store policy data. If a custom location

cannot be created on a specific server, the Backup Agent will use <InstallPath>\PolicyData.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [**Learn more >>**](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure the Management Service

You can specify the location and authentication credentials necessary to access the SQL Safe Repository. You can connect to the Repository database using Window Authentication or SQL Server Authentication.

✔ You can also change the [port assignment](#) for the Management Service.

What are the available fields?

Computer

Allows you to select the computer where the Management Service is located.

SQL Server

Specify the SQL Server instance that currently hosts the SQL Safe Repository.

Database

Allows you to specify the name of the SQL Safe Repository.

Windows Authentication

Allows you to specify Windows Authentication for accessing the selected SQL Server instance. Selecting this option uses the credentials of the Management Service to log on to the SQL Safe Repository.

SQL Server Authentication

Allows you to specify SQL Server Authentication for accessing the selected SQL Server instance. Selecting this option allows you to specify the SQL Server login ID and password you want to use to access the target SQL Server instance.

Test Connection

Allows you to verify that the Management Service can use the specified account to connect to the Repository database.

Configure E-mail Notifications

Allows you to configure the settings for sending email alerts. In this section you can also enable or disable the option for sending these notifications to the Windows Application Event Log on the Management Service Computer.

Repository Grooming

Allows you to specify how long (in days) you want to keep operational history, such as status messages for backup and restore operations. By default, the Repository is groomed every 30 days. Operational history older than 30 days is permanently deleted.

How do I configure the Management Service?

To configure the Management Settings you can use any of the following paths:

- Go to the **Tools** Menu and click **Repository and Management Service Settings**.
- Select the gear icon on the bar menu.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Import archived backup sets

SQL Safe allows you to import archived backup sets into the SQL Safe Repository to manage all your backups from one place.

- ✔ SQL Safe cannot import copies of backup files that have been previously deleted or groomed. You can still access the backup files from the alternate location through the Restore wizard.

How do I import archived backup sets?

You can find and add archive files created outside your current SQL Safe environment to the Repository. You can also use this feature to help you recreate the SQL Safe Repository in the event of a critical failure.

You can reach the **Locate Backup Sets** dialog from the **File** menu and then selecting **Import Backup Archive(s)**.

To import backup archives from a local folder:

1. In the **Locate Backup Sets** window, click **Browse Locally** .
2. Select the archive file to import.
3. Review the displayed backup set information and click **OK** .

To import backup archives from a remote share:

1. In the **Locate Backup Sets** window, click **Browse Remotely** .
2. Select the SQL Server instance from the drop-down menu.
3. Select the archive file to import.
4. Review the displayed backup set information and click **OK**.

To import backup archives from TSM tape backup:

1. In the **Locate Backup Sets** window, click **Browse TSM** .
2. Select the appropriate TSM options file.
3. Enter a High Level and Low Level search parameters and choose whether to include or not inactive files.
4. From the Results text box, select the found files to be imported.
5. Review the displayed backup set information and click **OK** .

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Manage licenses

The License Key Manager provides an intuitive, simple-to-use interface for SQL Safe license key management. You can:

- View the instances licensed with your current license
- Select which instances you want SQL Safe to take into account for your license key instance count
- See how many available instances you can still license for backup operations.
- Edit your license key
- Save your license information to a file

The Management Service manages your SQL Safe license and receives requests from the respective Backup Agents to license your instances.

How do I manage my licenses?

You may need to edit your current license if you exhaust your trial license, or if you need to replace it with one that allows you to license more instances.

To access these options, on the **Tools** menu, click **License Key Manager**. You can also click the key icon located on the task bar to access the same option.

What information can you see on the License Key Manager window?

On the License Key Manager window you can find:

- Your license keys
- Instances licensed for backup operations

On the License Keys tab you can find:

- Your current licenses keys, type, the number of instances allowed for each key, and the expiration date.
- Options for Removing and adding license keys.
- The number of Used licenses.
- An option for Automatically licensing instances for scripted agent deployments.
- An option to save this information to a file

On the Instances tab you can find:

- A list of the instances licensed for backup operations and all available registered instances.
- An option to license All or None of them
- An option for Automatically licensing instances for scripted agent deployments.

To upgrade a trial license to a permanent license:

1. On the **License Key Manager** window, on the License Keys tab, click **Add**.
2. Enter the respective license key.
3. Click **OK**. The license key will be displayed in the License Key Manager window.
4. If you want to save the list to a file, click **Save to a File** and save the file to your desired location.

What is a multi-instance license key?

A multi-instance license key allows you to centralize the license management with the SQL Safe Management Service. SQL Safe Backup Agents configured to this Management Service will use this licensing management method and enable you to enter a license key through the Management Console and support the licensing of a certain number of instances.

❗ Please take into account that a multi-instance key will replace any single instance keys previously installed and the user will be prompted to switch to centralized license management.

⚠ Standalone SQL Safe Backup Agents not configured to a SQL Safe Management Service will be treated as standalone installations and therefore use the old licensing model.

How can you license your instances for backup operations?

On the **License Key Manager** window, you can see the list of all your registered instances. Check or uncheck those instances that you want SQL Safe to license to perform backup operations. The number of available licenses will be updated according to your choices. Then click **OK**.

What are the terms of the trial license?

By default, SQL Safe installs with a limited 14-day time, unlimited instances trial license key. After you install the SQL Safe components using the Typical or Custom setups, the Management Console lists your trial license in the **License Key Manager**. This license key is stored in the SQL Safe Management Server.

What are the terms of the production license?

SQL Safe licenses are issued per SQL Server instance and for a specific time period. You can manage this license with the License Key Manager. The SQL Safe production license gives you full access to the Backup Agent through the Management Console, including operation status information.

What is the SQL Safe Lite license?

When you have different versions of SQL Safe deployed in your environment, one or more registered SQL Server instances may be running SQL Safe Lite.

SQL Safe Lite does not support backup and restore operations through the Management Console. For example, you cannot create a backup policy for a SQL Server instance running SQL Safe Lite.

If you want to manage all registered SQL Server instances through the Management Console, you can upgrade the SQL Safe Lite Backup Agents to the enterprise version of SQL Safe.

How do I upgrade my SQL Safe Lite license?

You can temporarily upgrade a SQL Safe Lite license to an enterprise edition license by installing a SQL Safe trial license. Note that, when the trial period has expired, your license will revert back to SQL Safe Lite.

You can then permanently upgrade a SQL Safe Lite license to an enterprise edition by purchasing a production license key and entering it in the License Key Manager.

To upgrade a SQL Safe Lite license:

1. In the **Servers** tree, expand the **SQL Server Instances** node, and then select the instance that is running the SQL Safe Freeware Edition Backup Agent.
2. Click **Enable Trial License** in the Backup/Restore Operation Status pane.

How do I upgrade my SQL Safe Freeware Edition?

You can upgrade SQL Safe Freeware Edition to SQL Safe enterprise edition by upgrading the Backup Agent on the corresponding SQL Server computer.

This installs the SQL Safe enterprise edition trial license. You can then permanently upgrade a SQL Safe Lite license to an enterprise edition by purchasing a production license key and entering it in the License Key Manager.

To upgrade a SQL Safe Freeware Edition Backup Agent:

1. Navigate to the **SQL Safe Agents** view.
2. Right-click the target SQL Server computer, and then select **Install SQL Safe Backup Agent** on the context menu.

How do I save my license keys to a file?

1. On the **Tools** menu, click **License Key Manager**.
2. Click **Save to File**, and browse to the location to which you want to save the file.
3. Enter the file name, and click **Save**.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Backup Agent configuration

How do I access the agent configuration information?

To manage your SQL Safe Backup Agents, click **SQL Safe Agents** in the navigation pane. To view information about a specific agent, click the corresponding SQL Server computer listed in the tree pane and you will be able to see the configuration information of the respective agent.

What agent configuration settings can I view?

The content pane in the SQL Safe Agents Settings view contains the agent configuration information. This information allows you to monitor and maintain the performance of each Backup Agent.

Column	Definition
Computer	Displays the name of the host computer.
Version	Displays the version number of the selected Backup Agent.
Management Server	Displays the location of the SQL Safe Management service that the Agent is configured to communicate with.
Max Load	Displays the maximum number of concurrent operations that the backup agent can perform.
Priority	Displays the Windows thread priority at which backup agent threads run.
Send Status	Displays the frequency that the agent is configured to communicate with the Management Server.
SQL Timeout	Displays the SQL DMO timeout value, which determines how long the Backup Agent will wait for a response from SQL Server before timing out.
VDI Trans. Limit	Displays the maximum size of a transfer block for the VDI operation.
VDI Buffers	Displays the number of buffers used for the VDI operation.
VDI Block Size	Displays the size of a VDI device block. All data transfers are integer multiples of this value.
VDI Timeout	Displays the timeout for configuring the VDI.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
----------------------	-----------------	-----------------	----------------	------------------	-----------------	------------------	--------------

Modify Backup Agent properties

You can modify many of the SQL Safe Backup Agent properties from the Management Console and adjust performance parameters to suit your system needs.

If the SQL Server instance is running SQL Safe Lite, the Send Status every x seconds option is ignored. SQL Safe displays operation status information only for Backup Agents running with an enterprise edition license.

If the SQL Server instance is running SQL Safe Freeware Edition, all settings are unavailable. You must upgrade the Backup Agent to either SQL Safe Lite or the enterprise edition to make changes to the Backup Agent properties. For more information, see [Manage licenses](#).

To change the agent properties:

1. In the navigation pane, click **SQL Safe Agents**.
2. Right-click the appropriate SQL Server instance.
3. Click **Properties** from the context menu.
4. Change the SQL Safe Agent properties to improve the performance of your backup and restore operations, or enable debug mode for troubleshooting an issue. For more information about SQL Safe Agent properties, see [View agent settings](#).
5. Click **OK**.

✔ You can also [change the port assignment](#) for the Backup Service.

How do I access Backup Agent properties?

To manage your SQL Safe Backup Agents, click **SQL Safe Agents** in the navigation pane. To view information about a specific agent, right-click the corresponding SQL Server computer listed in the tree pane, and then select Properties.

Why should I enable troubleshooting?

Occasionally when you contact Idera support for assistance, a representative will ask you to enable logging to get a better idea of what the issue is in your environment. SQL Safe allows you to customize your debug settings when troubleshooting an issue with your Backup Agent.

Is there a disadvantage if I leave debug mode enabled for a long period of time?

There is no disadvantage to leaving SQL Safe in debug mode for an extended period of time. If you experience an issue that occasionally and unexpectedly occurs, or you want to capture data over a long period of time, leave debug mode enabled. This settings gives you the advantage of already logging the data when the issue occurs.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

How the IR Service works

The InstantRestore Service manages the following properties, which are stored in the registry:

- Max number of concurrent hydrations
- Number of driver threads
- Large raw buffer IO size
- Hydration chunk sizes
- Decompressed block cache size
- Driver active IO list size

You must use the same Windows account for the Backup Agent and InstantRestore Service. During installation, you are asked to enter credentials for only one account and the other is created with the same information. If you manually change your account information, make sure you change it in the other service as well to avoid any issues.

How do I enable or disable the InstantRestore Service?

SQL Safe includes the InstantRestore (IR) Service during an installation or upgrade. Users can enable or disable the IR components using an Agent. If an InstantRestore operation is in progress when a user attempts to disable IR components, SQL Safe returns an error.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Modify your SQL Server list

SQL Safe provides the ability to add, remove, and group SQL Server instances from within the tree pane.

To add a SQL Server instance, click **Register SQL Server** in the **Common Tasks** of the **SQL Safe Today** view. You can also find the same option by right-clicking the SQL Server instances folders on the pane tree of the **Servers** view.

To group SQL Server instances, right-click the SQL Server instances folders on the pane tree of the **Servers** View and select **Add group**, then you can Register SQL Servers to add them to the respective group. Organizing your SQL Server instances into related groups can help you verify the backup status of specify types of SQL Server instances. For example, you can categorize servers based on location, purpose, importance, platform, or any other logical category.

To remove SQL Server instances, right-click the respective instance and select **Remove SQL Server**.

In the Servers tree, the SQL Server Instances node lists all the SQL Server instances you have registered with SQL Safe. However, this list may not reflect all registered SQL Server instances across your environment. For example, when your backup or log shipping policy contains instances registered by other database administrators, SQL Safe lists these instances in the Disc overed Instances node. Although you can delete this node, SQL Safe recreate the node after a policy status refreshed.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Register an instance

After creating a server group, you can add SQL Server instances to the group. Adding a SQL Server instance to SQL Safe does not affect the registered groups or SQL Server instances in SQL Server Enterprise Manager or SQL Server Management Studio.

- ✔ You can also register an instance "on the fly" when you back up the hosted databases through the Management Console.

To register a SQL Server instance with SQL Safe:

1. In the navigation pane, click **Servers**.
2. Right-click on the Server Group to which you want to add the SQL Server instance.
3. Select **Register SQL Server** from the context menu.
4. In the Available Servers list in the Register SQL Servers dialog, select the instance you want to add to the Server Group.
5. Click **Add >**. SQL Safe moves the selected server to the Added Servers list.
6. Select the required authentication method used to log in to the SQL Server instance, and then click **OK**.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Understand total cost of operation (TCO)

SQL Safe provides a built-in calculator to help you calculate your monetary return on your SQL Safe investment. You can view this calculator in the Disk Space Savings pane on the SQL Safe Today view.

The calculator attempts to measure the time and monetary savings you gain through using the SQL Safe compression scheme. The Return On Investment (ROI) calculator bases your ROI on the total cost of ownership of your storage devices multiplied by the amount of disk space savings you realize using SQL Safe. SQL Safe defaults to the commonly used estimate of \$200 per GB of storage. You can change this estimate to reflect your particular hardware configuration.

SQL *safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Manage debug settings

The Advanced Debug Settings display additional debug selections for troubleshooting the Backup Agent running on the selected SQL Server computer. You can also set the log file characteristics and maximum size depending on what issue you want to troubleshoot. It is recommended that you change these settings based on guidance from Idera support.

A rolling log allows you to create a log files that "roll" when they reach the maximum file size or the service is restarted, meaning that when the max size/restart occurs, it deletes the oldest information and logs the newest. This feature helps you avoid a large, cumbersome log file.

To change the debug settings:

1. In the navigation pane, click **SQL Safe Agents** .
2. Right-click the appropriate SQL Server instance.
3. Click Properties from the context menu.
4. Click **Advanced** .
5. Make the necessary changes, and then click **OK** .

How do I access debug settings?

To manage your debug settings, click SQL Safe Agents in the navigation pane. Right-click the name of the SQL Server instance for which you want to manage debug settings, and then select Properties. Click the Advanced button.

Once you make the appropriate changes, click OK on the Advanced Debug Settings. Make sure to select Enable Debug Mode on the SQL Safe Agent Properties, and then click OK or debugging is not enabled.

What log file settings can I change?

If you enable debug mode, SQL Safe creates a log file based on the settings in the Roll Log field s. You can choose one of the following options for the log file

No

Maintains the debug log as a single file that is unlimited in size. This option allows SQL Safe to capture diagnostic information over an extended period of time. Your log file may become very large and should be monitored to avoid any issues with file size.

Do not enable No unless absolutely necessary. Use No only when the problem being diagnosed occurs very infrequently and is not noticed in a timely manner. In almost all cases, increasing the size or number of files is sufficient for troubleshooting an issue and an unlimited file size is unnecessary.

Yes and keep *n* file(s)

Maintains the debug log as a series of files that are limited in size and quantity. This option allows SQL Safe to capture diagnostic information over a limited period of time, depending on the size and quantity of files kept. When a log file reaches the size limit or the service is restarted,

SQL Safe renames the file and starts a new log file. The older the log file, the higher the digit that exists at the end of the file name. For example, file `x.log.3` is more recent than `x.log.4`. When the log file rolls over and reaches the maximum quantity, SQL Safe deletes the oldest file and the next oldest file takes its place. Because the amount of space used by the logs is limited, this setting does not require you to monitor the log files.

- ✔ A **Yes** option is the recommended setting. Be aware that the amount of history retained is limited, and it may be possible for a problem being diagnosed to be missed. If this may be the case, first increase the quantity of files retained, then increase the size if necessary. Increasing quantity before size helps to maintain log files that are smaller and easier to view and send to Idera support.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View enterprise status for last 24 hours

The SQL Safe Today view provides an high-level record of backup and recovery operations across your enterprise.

Use this view to monitor the status of backup and restore operations and easily access the most commonly used tasks. This view automatically displays when you start the Management Console.

How do you access SQL Safe Today?

To use SQL Safe Today, click the **SQL Safe Today** globe icon in the task bar, or click **View > SQL SafeToday** from the menu.

What is the Status Summary?

The Status Summary provides a simple indicator to tell you at a glance whether backup and restore operations across your enterprise have been successful. The green check icon indicates success, and the red X icon indicates errors have occurred.

What are the Status Details?

The statistics pane shows the values for the following metrics:

- Number of policies whose status is OK (all operations have completed successfully)
- Number of policies whose status is not OK (includes a failed, skipped, or canceled operation)
- Number of successful operations
- Number of operation that failed (returned errors)

For more information, see [How policies work](#).

Why are SQL Safe Today statistics different than Server statistics?

The filter used by the SQL Safe Today statistics is different than that used by the Servers statistics. SQL Safe Today shows the status for all instances and databases. Servers shows status based on your filter settings plus the currently selected node and the databases under it.

What is Disk Space Savings?

The disk space savings pane shows the disk space savings achieved by using compression on your backup sets, and, using the TCO/GB parameter set in the SQL Safe Preferences, calculates your return on investment (ROI) using SQL Safe for your SQL Server instance backups. For more information on calculating TCO, see [Modify Total Cost of Operation \(TCO\) Preferences](#).

What tabs are available on the SQL Safe Today view?

There are two tabs available for you to choose on the SQL Safe Today view:

- Policies
- Backup and restore operations

What can you find on the Policies status tab?

The Policies tab displays the current status of your Backup and Log Shipping policies.

When the Policies tab is selected, all existing policies are displayed with the following columns:

Column Header	Definition
Status	Status can be ok, or display a warning or error state.
Name	Displays the policy name.
Databases Covered	Displays the number of databases covered by the policy.
Last Backup Time	Displays the start date and time of the last backup executed by the policy.
Last Backup Failure Time	Displays the start time of the last failed backup executed by the policy.

For more information, see [Backup policies](#) and [How Log Shipping Policies work](#).

What can you find on the Backup & Restore Operation status tab?

The Backup & Restore Operations tab displays the current status of the backup and restore operations that were scheduled to run today.

When the Backup & Restore Operations tab is selected, all existing operations are displayed with the following columns:

Column Header	Definition
Progress	During an operation, the progress bar will denote the percentage of the operation completed. When the operation is complete, it will display a green bar labeled 100%. When an operation completed with errors, this column will display a red bar labeled Error. This column also indicates when the backup file has been deleted (groomed), and therefore is no longer available to be restored.
Instance	Displays the instance name that was backed up or restored by this operation.
Icon	Displays an icon if the backup includes maps containing metadata for InstantRestore and SQL virtual database. For more information about InstantRestore, see How InstantRestore works . For information about SQL virtual database, see Recover objects using SQL virtual database .
Database	Displays the database name that was backed up or restored by this operation.

Operation	Displays the operation performed. The options are Backup, Restore, and Verify.
Backup Type	Displays the type of the backup performed by the operation. The options are Full, Log, Differential, and File.
Start Time	Displays the start date and time of the operation.
Duration	Displays the number of seconds required to complete the operation.

Can you customize the columns in the grid?

You can sort by the content of any of the columns by clicking on the column header.

How do you refresh the operations status?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking on the refresh icon in the pane title bar.

What are the Common tasks?

The Common Tasks are shortcuts to some of the more frequently performed actions in SQL Safe.

Task	Definition
Register SQL Server	Allows you to add a new SQL Server instance.
Backup Database	Starts the SQL Safe Backup Wizard, which allows you to back up one or more databases. For more information about the Backup Wizard, see Perform a manual backup .
Restore Database	Starts the SQL Safe Restore Wizard, which allows you to restore one or more databases. For more information about the Restore Wizard, see Restore a database .
Create New Policy	Starts the SQL Safe Backup Policy Wizard, which allows you to create a new backup policy. For more information about the Backup Policy Wizard, see How backup policies work .
Manage Agents	Changes the Console display to the settings view. From here, you can modify your SQL Safe Agent settings. For more information about agent settings, see View agent settings .

Attach Virtual Database	If you have installed SQL virtual database, this will launch the SQL virtual database console. For more information about SQL virtual database, see Recover objects using SQL virtual database .

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View SQL Server status

The Group, Instance, and Database views display backup and restore details and operation status for all SQL Server instances registered with SQL Safe, as well as at-a-glance summaries of important administrative information. You can view information about a group of SQL Server instances, a single instance, or a database.

For this node ...	You can view ...
A server group	Displays the total number of instances in the group, the number of successful and failed operations, and the number of instances up and the number of instances not connected at the time.
An instance	Displays whether the connection to SQL Server is active, the number of successful and failed operations, whether the SQL Safe Backup Agent is running, the SQL Safe version, the license status, the number of databases on the instance, and the SQL Server version it is running. You can also find the backup and restore operations status for the last 7 days.
A database	Displays whether the database is currently online, the number of successful and failed operations, and the date of the last backup performed on the database. You can also find the backup and restore operations status for the last 7 days.

To manage your SQL Server instances, click **Servers** in the navigation pane, and then click the appropriate node in the Servers tree.

-  You can re-run any previous backup operation from these views. To re-run a backup, right-click the appropriate operation, and then select **Back Up Again** (executes backup using previous settings) or **Back Up with Different Options** (opens the Backup wizard). You can also quickly restore the backup files associated with a specific operation.

What SQL Safe settings are managed in the instance view?

You can install any options you did not include during your initial SQL Safe installation. Click **Settings** in the Instance Information area, and then select one of the following options, if available:

- [Install SQL Safe Backup Agent / Upgrade SQL Safe Backup Agent](#)
- [Install SQL Safe Extended Stored Procedures](#)
- [Update license](#)
- [Enable/Disable SQL Safe InstantRestore](#)
- [SQL Safe Agent Properties](#)

SQL **safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View backup/restore operation status

The Backup/Restore Operation Status area displays a listing of all backup and restore operations performed for the selected object for the last 7 days. To change how much status information you see, click **Filter** and then select a different date **Range** in the **Event Time** settings.

- ✔ You can re-run any previous backup operation from this grid. To re-run a backup, right-click the appropriate operation, and then select **Backup Again** (executes backup using previous settings) or **Backup with Different Options** (opens the Backup wizard). You can also quickly restore the backup files associated with a specific operation.

What column information can I select?

Column	Definition
Backup Type	Displays the type of the backup performed by the operation. The types are Full, Log, Differential, and File.
Compressed	Displays the size of the backup file after compression.
Database	Displays the name of the database that was backed up or restored by this operation.
Database Size	Displays the size of the original database.
Duration	Displays the time (hours:minutes:seconds) required to complete the operation.
Encryption	Displays the type of encryption SQL Safe used during the backup operation.
End Time	Displays the end date and time of the operation.
Instance	Displays the name of the SQL Server instance that was backed up or restored by this operation.
Operation	Displays the type of operation performed. The types are Backup, Restore, and Verify.
Icon	Displays an icon if the backup includes maps containing metadata for InstantRestore and SQL virtual database. For more information about InstantRestore, see How InstantRestore works . For information about SQL virtual database, see Recover objects using SQL virtual database .

Progress	During an operation, the progress bar will denote the percentage of the operation completed. When the operation is complete, it will display a green bar labeled 100%. If an operation completed with errors, this column will display a red bar labeled Error. If an operation completed with warnings, this column will display a yellow bar labeled 100% with an asterisk. This column also indicates when the backup file has been deleted (groomed), and therefore is no longer available to be restored.
Ratio	Displays the ratio of the Uncompressed size of the database reported by SQL Server to the resulting Compressed size of the backup file created by SQL Safe.
Result Text	Displays text describing the results of the operation.
Start Time	Displays the start date and time of the operation.
Threads	Displays the number of threads SQL Safe used during the backup operation.
Uncompressed	Displays the size of data contained in the database, as reported by SQL Server.

Can I customize the columns in the grid?

Task	Action
Add or remove columns in the grid	Click Filter in the pane title bar, then select the columns you want to display in the grid.
Sort the content of a column	Click on the column header to sort the column in ascending order; click again to sort the column in descending order.
Rearrange the order of the columns	Click on the column header and drag it to a new position in the grid.
Group column headings	Click on the column header and drag it to a position beneath the column header by which it will be grouped.

How do I refresh the operations status?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

Why is the Backup/Restore Operation Status grid blank?

SQL Safe only displays operation status information for Backup Agents running with an enterprise edition license. If the Backup Agent has a SQL Safe Lite or SQL Safe Freeware Edition license, this pane will be blank.

You may view the operation status for SQL Safe Lite or SQL Safe Freeware Edition Backup Agents by installing a purchased license. To use a trial before purchase, click [Enable Trial License](#). For more information, see [Manage license](#).

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Define your Backup and Recovery Strategy

Before performing database backups within your SQL Server environment, establish a backup and restore strategy. Your strategy should consider the following points:

- Data availability needs
- Data loss impact
- Recovery model you want to use: Simple, Full, or Bulk-Logged
- Restore process you want to use: InstantRestore or normal
- Data storage space allotted to backup storage

SQL Safe supports whatever strategy you decide to implement, while allowing you to take advantage of the fastest, most efficient SQL Server backup solution available. You can create custom backup and restore policies that ensure your data is archived and recovered according to your corporate standards and Service Level Agreements (SLAs).

If your strategy includes tape backup, SQL Safe also allows you to easily integrate the third party data-protection product, Tivoli Storage Manager (TSM), into your backup strategy. For more information, see [Integrate SQL Safe with TSM](#).

If your SQL Server environment requires FIPS compliance, see [Ensure FIPS compliance](#).

How do I define a backup and recovery strategy?

Use the following checklist to ensure you have everything in place to successfully implement your backup strategy.

<input checked="" type="checkbox"/>	Follow these steps ...
<input type="checkbox"/>	Determine the backup types you want to perform for your different SQL Server instances.
<input type="checkbox"/>	Determine what type of compression you need.
<input type="checkbox"/>	Determine the type of encryption you want to use.
<input type="checkbox"/>	Identify which databases should be routinely archived using backup policies .
<input type="checkbox"/>	Identify which databases should be routinely recovered using restore policies .

How can I get my database up and running quickly during a restore?

SQL Safe's InstantRestore feature is the fastest way to get your database back online. Under certain conditions, [InstantRestore](#) allows you to restore your database while providing your users with quick access to the database during this process. Note that you may experience some performance issues because the restore is still running while you attempt to use the database.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How the Backup Agent works

The Backup Agent performs backup and restore operations. The agent is a service that runs on the target SQL Server instance. When you request a backup or restore operation, the Management Console wakes the previously deployed Backup Agent. Take into account that the Backup Agent must be licensed to perform any operation, if it is not licensed yet, the Agent will contact the Management Service to request a license.

While executing the backup or restore operation, the agent periodically sends messages to the Management Service.

How do I install the Backup Agent?

You can install the Backup Agent locally using the setup program or deploy the Backup Agent remotely using the Management Console. To install the agent in an environment that does not contain a SQL Safe Management Service and Repository, use the Agent Only setup type provided in the setup program. The Backup Agent will contact the Management Service to request licensing. For more information, see [License Management](#).

How can I upgrade my Backup Agent?

You can configure SQL Safe to automatically upgrade the Backup Agent to the current software version in the SQL Safe Preferences window. For more information, see [Configure your deployment](#).

Can I run the Backup Agent without receiving messages?

You can run the Backup Agent in silent mode. Silent mode allows you to use the Backup Agent in environments that do not require the Management Service or SQL Safe Repository.

When in silent mode, the Backup Agent does not return status information about backup and restore operations. Use this mode if you do not plan to track backup and restore status, or if you plan to perform backup and restores through the command-line interface only. This flexibility allows you to easily integrate SQL Safe into your existing backup and recovery infrastructure so you can take advantage of SQL Safe features without changing your established processes.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How to choose backup type

SQL Safe supports four standard database backup types:

- Full Backup
- Differential Backup
- Transaction Log Backup
- File Backup

You can use a backup type exclusively or combine types to fit your backup strategy.

What is a full backup?

A full backup creates a full copy of the data in a database. Full backups usually run at regularly scheduled intervals and require more storage space and time to complete. Full backups copy data and transaction log pages to the backup set. The backup is smaller than the database itself because unused space is not retained.

Full backups allow you to restore your database to its original state prior to backup. During the restoration of a full backup, the SQL Server instance being restored rolls back uncommitted transactions. Use transaction log backups to recover uncommitted transactions.

What is a differential backup?

Differential backups record only the data that changed since the last full backup. Consider using differential backups on active SQL Server instances where minimal database downtime is critical. Smaller and faster differential backups allow you to make more frequent backups with less impact on your server. Performing frequent backups helps maintain optimal database availability and minimizes data loss risks. Differential backups allow you to restore your database to the last completed differential backup.

What is a transaction log backup?

A transactional log backup creates a copy of the transaction log file. It sequentially records all database transactions that occurred since the last transaction log backup. In conjunction with a full or differential database restore, restoring a transaction log backup allows you to recover the database to the point of failure or a specific time.

Typically transaction log backups do not require intensive resource usage and can be scheduled more frequently than other backup types. Ensure you increase the frequency of your transaction log backups if your database has a high transaction rate. Also, consider storing critical transaction log backups on fault-tolerant storage devices.

While you cannot execute a transaction log backup during a full or differential backup, you can during a file backup. Ensure you create database or file backups before backing up the transaction log. The transaction log contains only the database changes made after the creation of the last backup.

What is a file or filegroup backup?

Backs up either individual files or all files in a filegroup within a database. Backing up single files or filegroups allows you to restore only corrupted files. Restoring only corrupted files increases recovery speed. Consider file and filegroup backups when your database has one or all of the following attributes:

- Database size hinders regular full or differential backups
- Database can be unavailable for short periods of time only
- Specific files are either regularly corrupted, are more critical, or change more frequently than others

You can back up files or filegroups and transaction logs at the same time.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How to choose compression and encryption

SQL Safe offers a unique combination of state-of-the-art compression and encryption technologies. These technologies set SQL Safe apart and make it unique in the SQL Server backup arena. You designate the compression rate necessary to match your storage needs, and you select the level of encryption you need to ensure data security within your environment.

For more information on the compression levels available, see [Understand compression levels](#) and [Understand IntelliCompress options](#). For information on how selecting the appropriate compression scheme reduces your storage costs, see [Understand Total Cost of Operation \(TCO\)](#)

SQL Safe automatically detects whether your environment requires compliance with the Federal Information Processing Standard (FIPS), and then chooses the appropriate encryption algorithm. For more information, see [Ensure FIPS compliance](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Ensure FIPS compliance

You can use SQL Safe to back up and restore SQL Server databases in environments where Federal Information Processing Standard (FIPS) compliance is required. SQL Safe automatically detects whether the target SQL Server instances require FIPS compliant encryption. When this security setting is detected, SQL Safe uses the FIPS-compliant AES encryption algorithms provided by Microsoft.

For more information about FIPS compliance, see the corresponding [Microsoft TechNet Web Article](#) and [Microsoft Knowledge Base Article](#).

How do I know whether my environment requires FIPS compliance?

Ask your Windows security administrator whether the FIPS system cryptography setting has been enabled in the Local Security Policy or a Group Policy that applies to the SQL Server computer.

Are there additional product requirements to support FIPS?

No, FIPS compliance for SQL Safe does not require any additional software to be installed.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Understand compression levels

SQL Safe allows you to set the compression rate suited to your backup needs. You designate a default compression level during the initial setup of SQL Safe. Any time prior to initiating a backup, you can modify your compression level.

How do I choose the best compression level for my environment?

The compression level that is best for your environment depends on your storage and performance needs. Before you choose a compression level, determine whether you need maximum storage and compression (lower performance) or maximum performance (lower compression).

Compression rates and backup times depend on the following factors:

- Whether the SQL Server computer utilizes multiple processors
- Whether you are striping data to multiple backup files
- Available bandwidth on your network connections
- Current processing load, such as backing up multiple databases in the same job
- The type of data you are backing up (for example, text compresses to a smaller size than binary data)

Level 1

Low compression. Provides high execution speed and minimal server load. This compression level typically provides 75-90% compression rates on text data. This compression rate may significantly decrease if you are backing up a database that contains binary data or previously compressed data. Use this compression level if you want to perform fast backups, sometimes during business hours, at the expense of a larger size.

- ✓ In environments with a slow write speed, this level will not produce backups as fast as higher levels of compression.

Level 2

Medium compression. Provides good data compression while maintaining high-speed execution. This compression level places a moderate load on your server to provide increased compression. This compression level works well in environments with a good balance between multi-processor servers (for example, a 4- to 6-way SMP server) and IO speed.

Use this compression level if your environment includes one or more of the following conditions:

- You want to increase compression without significantly impacting performance
- You can schedule backups during off-hours, if needed

Level 3

High compression. Provides a high level of compression while slightly decreasing execution speed. This compression level provides significant reduction in backed up data size, while placing a higher load on your server. This compression level works well for nightly backups in environments with a powerful multi-processor servers (for example, an 8-way SMP server) where saving space is a high priority.

Use this compression level if your environment includes one or more of the following conditions:

- You want to maximize compression without significantly impacting performance
- You can schedule backups during off-hours, if needed

Level 4

Ultra-high compression. Provides the highest level of compression, to be used when saving space is critical. This compression level places a high load on your server. To achieve acceptable run times, this level should be used on very powerful servers with 8 or more processors and generally only during off-peak periods.

Use this compression level if reduction in backed up data size is your primary objective.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Understand encryption levels

SQL Safe allows you to set the encryption level most appropriate for your backup needs. During the initial setup of SQL Safe, you can select a default encryption level. Any time before executing a backup, you can strengthen or lessen the encryption applied to the current backup.

You must have a password in order to restore an encrypted backup. For security reasons, when you generate a T-SQL or CLI script of an encrypted backup, SQL Safe does not write the specified password to the script. To successfully run the script, supply the appropriate password. SQL Safe also does not store encryption passwords and cannot recover lost or forgotten passwords.

- ✔ SQL Safe automatically detects whether the target SQL Server instances require FIPS compliant encryption. When this security setting is detected, SQL Safe uses the FIPS-compliant AES encryption algorithms provided by Microsoft. For more information about FIPS compliance, see [Ensure FIPS compliance](#).

SQL Safe encryption offers you the following encryption methods, allowing you to choose based on your security needs:

None

Provides the fastest execution speed and does not encrypt backed up data.

Advanced Encryption Standard (AES) 128-bit

Provides a strong encryption. The AES algorithm encrypts data in 128-bit blocks using a 128-bit key.

Advanced Encryption Standard (AES) 256-bit

Provides a stronger encryption. The AES algorithm encrypts data in 128-bit blocks using a 256-bit key. This method provides more secure encryption than AES 128-bit.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Understand IntelliCompress

SQL Safe offers IntelliCompress compression levels to maximize compression performance for your backups. Each time you run a backup using an IntelliCompress compression level, SQL Safe analyzes your backup data and determines the best algorithm to use. This customization optimizes the performance, no matter how the backup data may have changed since the last backup. Analyzing the data each time you run a backup provides the best compression rate for each backup, so your data is compressed in the optimal way each time, saving you time and disk space.

IntelliCompress – Optimize for Speed (iSpeed)

Provides maximum performance by automatically optimizing for speed. At each backup, SQL Safe selects a compression ratio that provides the fastest backup in that environment. This compression level meets most storage and performance needs. We recommend this compression level, particularly if you are backing up databases that contain text data.

IntelliCompress – Optimize for Size (iSize)

Provides high compression by automatically optimizing for size. At each backup, SQL Safe selects the best mix of compression and speed based on CPU power and read/write speed.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How script generation works

You can generate CLI and T-SQL scripts for backup and restore operations through the Backup and Restore wizards. SQL Safe generates the CLI or T-SQL script using the settings you specified for the backup or restore operation.

CLI scripts can be run as a batch file from the command line prompt. Generated CLI scripts use supported options for the backup and restore actions.

T-SQL scripts can be run through Query Analyzer or as a scheduled SQL Server job. Generated T-SQL scripts leverage the SQL Safe XSP to execute backups and restores.

If you need a command line or T-SQL script for your backup or restore, SQL Safe provides the **Generate Script** button to let you generate CLI and T-SQL scripts for these operations. When you use a wizard to run a backup or restore, SQL Safe disables this button until sufficient criteria exists to generate a script. SQL Safe generates the CLI or T-SQL script using the settings you specified for the backup or restore operation.

How do I generate script?

You can generate script through the Backup Wizard or the Restore Wizard once your settings provide SQL Safe with enough information to create the script. Click **Generate Script**, and SQL Safe displays command line script by default. Click the **T-SQL** button and SQL Safe displays the script in T-SQL format.

To retain your script in either format, click the **Save to a file** or **Copy script to clipboard** icon. SQL Safe also allows you to use normal select, cut, copy, and paste functionality directly on the displayed script.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How threads affect backups and restores

By default, SQL Safe automatically calculates the optimal number of threads necessary to process a backup or restore operation. You can calculate the number of threads for your environment based on the processors available on the computer running the SQL Server databases you want to backup. Consider performing several backups to find the appropriate number of threads for your environment. To calculate the appropriate number of threads for your environment, use the following guidelines. Also consider other loads on the SQL Server computer that may affect CPU performance and availability.

Number of CPUs	Number of Threads
Single processor	1
Multiple processors	(number of CPUs)-1

You can set the appropriate number of threads when backing up a database through the Management Console. You can customize the number of threads you want SQL Safe to use when performing a backup or restore. A similar number of threads used in each operation ensures that you achieve the same performance optimization for your backups and restores.

- ✔ For SQL Server 2000 instances, selecting 12 or more threads can cause the backup operation to fail.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Recover objects using SQL virtual database

SQL Safe integrates with SQL virtual database through the Backup Wizard and Backup Policy Wizard to provide you with a more powerful recovery solution.

SQL virtual database allows you to:

- Recover any object from the backup file without having to restore the database
- Analyze and report on objects and permissions in backup files without having to restore the database
- Access backup files as though they were read-only databases

When creating a backup or backup policy, you can check the option to generate metadata for use by SQL virtual database. This metadata includes data files for each database included in your backup. Generating metadata is optional; SQL virtual database can attach SQL Safe backup files without the metadata. However, these data files improve SQL virtual database performance during the creation of the virtual database.

If you have SQL virtual database installed, click **Attach Virtual Database** to launch the SQL virtual database Console. From the Console, you can create virtual databases from a single full backup file or multiple backup files. You can also create multiple virtual databases from the same backup file, which allows you to make virtual databases that include data from different points in time. Once created, the virtual databases can be fully managed and queried using Microsoft SQL Server Management Studio or another database management tool.

What is SQL virtual database?

SQL virtual database is a powerful one-of-a-kind solution that lets you attach SQL Server backup files and query them like real databases. With its revolutionary, patent-pending technology, you gain instant access to critical data in a backup file without spending the time and storage previously required for restore. In minutes, you can create a virtual database and then use any native SQL Server or third party tools to query and extract the data you need.

For more information about SQL virtual database, see the [SQL vdb online Help](#)

Are there disk space recommendations for the SQL virtual database metadata?

Use the following table to help you set aside the appropriate amount of disk space for the virtual database metadata SQL Safe generates. Typically, this metadata requires only a fraction of the disk space consumed by a fully restored backup.

Size of Backup	Additional Disk Space
1 TB	105 MB
500 GB	51 MB
100 GB	10 MB
1 GB	105 KB
500 MB	51 KB

For more information about the virtual data files that SQL virtual database creates, see the [SQLvdb online Help](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Automate Backups and Restores

A SQL Safe policy consists of a set of databases for which a set of disaster recovery operations will be performed according to a defined schedule.

Backup policies allow you to quickly and easily schedule backups for large sets of databases that have similar needs. Log shipping policies allow you to schedule the synchronization of transaction logs between a primary database and one or more secondary databases. Restore policies allow you to schedule the routine recovery of a specific database.

You can use policies to enforce corporate standards or Service Level Agreement (SLA) requirements.

- [Create a backup policy](#)
- [Create a log shipping policy](#)
- [Create a restore policy](#)

How do I access policies?

To view status of any policy, click **Policies** in the navigation pane, and then select the appropriate policy listed in the tree pane. SQL Safe provides an at-a-glance record of your policy statuses.

You can view information about all your policies (per type) or view the status of an individual policy. You can also create new policies or edit existing policies from these views.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Deploy maintenance plans using SQL Safe

You can use the SQL Safe log shipping, backup, and restore policies to automate and enforce your disaster recovery requirements or Service Level Agreements (SLAs). Note that SQL Safe no longer provides the Maintenance Plan Conversion Utility.

How to use log shipping policies as maintenance plans

Use the following steps to create a new [log shipping policy](#) based on an existing SQL Server Log Shipping maintenance plan.

To create a log shipping policy based on a maintenance plan:

1. Use SQL Server Management Studio to connect to the SQL Server instances for which you have a native maintenance plan.
2. Disable the backup jobs associated with the primary instance.
3. Allow all restore jobs associated with the secondary instances to complete, and then disable these jobs.
4. Start the SQL Safe Management Console, and start the [Log Shipping Policy wizard](#).
5. On each wizard window, specify the appropriate options, and then click **Finish**. Because the selected instances were previously included in a native maintenance plan, you do not need to initialize the secondary instances.
6. Test your new log shipping policy by [tracking the policy status](#).
7. Delete your native maintenance plan.

How to use backup policies as maintenance plans

Use the following steps to create a new [backup policy](#) based on an existing SQL Server maintenance plan.

To create a backup policy based on a maintenance plan:

1. Use SQL Server Management Studio to connect to the SQL Server instances for which you have a native maintenance plan.
2. Disable the backup jobs associated with this plan.
3. Start the SQL Safe Management Console, and start the [Backup Policy wizard](#).
4. On each wizard window, specify the appropriate options, and then click **Finish**.
5. Test your new backup policy by [tracking the policy status](#).
6. Open your maintenance plan and delete the tasks that performed your backups, and then enable the appropriate jobs associated with this plan. ***If your maintenance plan performed backups only***, delete your native maintenance plan.

How to use restore policies as maintenance plans

Use the following steps to create a new [restore policy](#) based on an existing SQL Server maintenance plan.

1. Create a [backup policy](#) that archives the databases you want to routinely restore.
2. Test your backup policy by [running the policy jobs](#). This action also creates source backup files for your new restore policy.
3. Use SQL Server Management Studio to connect to the SQL Server instances that have a native maintenance plan you want to replace.
4. Disable the backup and restore jobs associated with this plan.

5. Start the SQL Safe Management Console, and start the [Restore Policy wizard](#).
6. On each wizard window, specify the appropriate options, and then click **Finish**.
7. Test your new restore policy by [tracking the policy status](#).
8. Open your maintenance plan and delete the tasks that performed your backups and restores, and then enable the appropriate jobs associated with this plan. ***If your maintenance plan performed backups and restores only***, delete your native maintenance plan.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Backup policies

Backup policies allow you to define backup maintenance plans across multiple SQL Server instances in your enterprise. These instances can reside on one or more physical servers.

SQL Safe offers backup policies, [restore policies](#), and [log shipping policies](#) to address different needs.

What is a backup policy?

A backup policy consists of a list of databases you want to back up, a set of backup operations to be performed on those databases, and a set of schedules according to which the backups will be performed. You can choose to create the associated jobs to run on a specific schedule, run on demand (execute the jobs manually from the Management Console), or you can choose to define your policy for monitoring purposes only. You can then monitor the status of each backup, all from a single point of contact in the Management Console.

How do I incorporate backup strategies in my policies?

Implementing a policy requires that you have a clear understanding of your backup strategy. To determine a backup strategy to use, consider the following recovery model requirements.

Model	Full Backup?	Differential Backup?	Transaction Log Backup?	File or Filegroup Backup?
Simple Model	Required	Optional	N/A	N/A
Full Model	Required	Optional	Required	Optional
Bulk-Logged Model	Required	Optional	Required	Optional

What constitutes a good backup strategy?

Consider using all four backup types to maximize your recovery and minimize your data loss. A basic backup strategy fulfills the following needs:

1. Creation of regularly scheduled database backups
2. Creation of frequent differential backups between full backups
3. Creation of transaction log backups more frequently than differential backups

Database backup creation depends on server activity and data sensitivity. Ensure you implement a strategy and create policies that back up both user databases and system databases.

How do backup policies help me?

Backup policies allow you to plan and schedule your SQL Server backup maintenance, as well as monitor its success and failures, all from a single point of contact at the Management Console. By allowing the application and scheduling of a set of backup operations across all of your SQL Server instances enterprise-wide, SQL Safe policies make updating your maintenance plans a quick and easy process.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Create a backup policy

The SQL Safe Backup Policy wizard allows you to create backup maintenance plans across your enterprise. A SQL Safe Backup Policy is defined as a set of databases for which a set of backup operations will be performed according to a defined schedule. If you choose to create backup jobs for this policy, SQL Safe creates SQL Server jobs for the specified backups.

How do you access the Backup Policy wizard?

You can access the Backup Policy Wizard from any of the following paths:

- Go to the task bar, click **Create Policy** and then choose **Backup Policy**.
- On the Policies tab, click **Create New Policy** located on the **Operation Summary** section of the **Backup Policies Status** window. This option is only available before you create your first backup policy.
- On the Policies tab, right-click the Backup Policies folder and select **Create Backup Policy**.
- From any tab, go to the **File** menu, select **Create Policy** and then **Backup Policy**.
- You can also find this option on the **SQL Safe Today** view, by going to the **Common tasks** and then selecting **Create New Policy**.

To get started with the Backup Policy wizard:

1. Name the policy.
2. Select the databases you want to back up.
3. Select backup options.
4. Specify where you want to store the backup files.
5. Schedule when and how often you want the backup to occur.
6. Get email notifications about the policy status.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Name the policy

The General tab of the Backup Policy wizard allows you to specify the basic properties of the backup policy.

Why should I specify a name or description?

You are required to enter a unique name for each policy.

Both the name and description will appear in the status messages for your policies. Using a meaningful name and description will allow you to more easily identify problems when they occur. For example, consider specifying a description that will help you later choose the correct backup to restore during a disaster recovery situation.

Which policy action should I choose?

Choose the action that best reflects how you want to use this policy. You have multiple options in this section:

- Monitor and automatically create backup jobs using the SQL Server Agent
- Monitor and automatically create backup jobs using the SQL Safe Backup Agent
- Monitor only

The first option allows you to create the policy for monitoring database backups and automatically creates the backup jobs using the SQL Server Agent on your SQL Server instances. Creating jobs allows to enforce consistent backup settings across your environment.

The second option allows you to create the policy for monitoring database backups and automatically creates backup jobs using the SQL Safe Backup Agent which is in charge of executing and scheduling these policies.

The third option creates the policy only to monitor database backups and no jobs are created. By default, SQL Safe will monitor the status of any backup operation that meets the criteria of your policy.

 Note that SQL Server Express does not support the SQL Server Agent. As a result, you must use the second option if you add any instance with SQL Server Express in your policy. This option allows the SQL Safe Backup Agent (second option) to create your policy backup jobs.

 If you choose to use the SQL Safe Backup Agent, policy data files will be stored by default at *C:\Program Files\Idera\SQL Safe\PolicyData*. You can change these settings by going to the **Policy Data** tab on the [Management Console Preferences](#) and selecting or creating the folder directory where you want to store these files.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select databases

Use the Membership tab of the Backup Policy wizard to select which SQL Server instances and databases you want to monitor with this policy. You can also exclude one or more databases from this policy.

To make your selections, click **Add/Remove Instances**, and then choose the instances from where you want to backup databases. Then select from the different options for choosing databases (**All Databases**, **All User Databases**, **All System Databases**, **Specific Databases**). By choosing one of the "All" database options, the policy will automatically include the relevant databases as they are added or removed on the server.

✔ You may select databases from different servers for one policy.

✔ When you choose the databases you need to backup you can also specify those ones that you want to exclude from your policy, for this option move the ones you want to exclude to the list on the left.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure options

The Options tab of the Backup Policy wizard allows you to enter the backup types and options for each operation included in the backup policy.

What information is on this tab?

For each backup operation you include in the backup policy, you can select compression, encryption, and verification options, enable object-level recovery, and set additional advanced options such as removing inactive entries from the transaction log.

What types of backup can you choose?

On the Options tab you can choose the types of backups you want for your backup policy. You can specify one, two or the three types of backup: **Full**, **Differential**, **Log**, just select the respective backup types and provide their settings.

Why can't you see the options for all the backup types?

The options for each backup type are hidden unless the backup type is selected for the policy. For more information about backup types, see [Understand backup types](#).

What types of compression algorithms are available?

- None
- IntelliCompress, optimize for size (iSize)
- IntelliCompress, optimize for speed (iSpeed)
- Levels 1, 2, 3, 4

✔ Backup operations using Level 1 complete fastest but achieve the least amount of compression. Level 4 achieves maximum compression but the backup operation may take longer.

For more information about backup compression, see [How to choose compression and encryption](#).

What types of encryption algorithms are available?

- None
- AES (128-bit)
- AES (256-bit)

If your SQL Server environment requires FIPS compliance, use the AES encryption option. For more information, see [Ensure FIPS compliance](#).

⚠ When you choose to encrypt an archive, you must designate a password. For security reasons, SQL Safe does not store this password. Ensure you remember the password you select.

What additional options are available?

For each type of backup you select, you can also specify the following advanced options:

Options	Description
Verify the integrity of the backup when complete	<p>Performs a data integrity check after the backup is created. SQL Safe verifies the integrity of the data files in the backup set created by this backup.</p> <p>Verifying the backup helps identify potential issues that could occur when restoring these data files.</p>
Generate maps	<p>Generates maps containing metadata for each database included in your backup file. Depending on the number of transactions completed since your last backup, generating maps may impact the performance of the backup operation. Generating maps is optional, but must exist in the backup file for InstantRestore to accept and restore that file. SQL virtual database can attach SQL Safe backup files without the metadata, but the data files improve SQL vdb performance during creation of the virtual database. For more information, see Recover objects using SQL virtual database. This option is selected by default.</p>
Include database logins in backup file	<p>Copies SQL login information for the selected databases, including credentials and privileges, when the backup files are written. To help ensure the security of your SQL Server database, SQL Safe encrypts the login information. This option is available for full backups only.</p>
Thread Count	<p>Allows you to specify how many threads you want SQL Safe to use to distribute the backup operation across multiple processors on the target SQL Server computer. Use this setting to optimize backup performance. When the resultant backup file is restored, SQL Safe uses the same thread setting to ensure consistent performance. Select Auto to have SQL Safe determine the optimal thread count for your environment.</p>
Transaction Log	<p>Removes all completed transactions, inactive entries, from the transaction log after SQL Safe finishes the backup.</p>

Checksum: Generate	Generates a checksum for the backup file.
Checksum: Ignore Errors	Ignores any errors from the generated checksum. <i>If checksum errors are encountered</i> , this option indicates that SQL Safe should continue to back up this database.
Backup: Copy only	Specifies a copy-only backup. This is a copy of the database and cannot be used as part of a restore strategy. It will allow you to take a "snapshot" backup of your database without interfering the LSN (log sequence number) order of your backup strategy.
Backup: Read-write filegroups	Specifies a partial backup, which includes the primary filegroup and any read-write secondary filegroups. Read-write filegroups are not supported by SQL virtual database. <i>If this option is selected</i> , the Generate metadata option (Generate maps for InstantRestore and SQL virtual database) will be disabled. Additionally, backups created with the read-write filegroups option cannot be used by SQL virtual database to create virtual databases.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select location

The Locations tab of the Backup Policy wizard allows you to specify the backup location for each operation you include in the backup policy.

What information is on the Locations tab?

For each operation you have included in the backup policy, you can specify the location type, full path in which to store the backup file, an optional housecleaning schedule for existing disk archives, and the backup file extension.

What types of backup locations can you use?

SQL Safe supports the following location types:

- Back up to a single file on the local computer or a network share
- Back up to multiple striped files on the local computer or a network share
- Back up to tape using Tivoli Storage Manager
- Back up to Data Domain

What do you do if you don't have an existing archive?

If you do not specify an existing archive, SQL Safe creates a new backup set with the name you specify. The location entered for each backup type must be valid for all SQL Server instances. You can choose to **Append** or **Overwrite** if the archive already exists.

What accounts can you specify to access the backup files location?

Depending whether you selected to use the SQL Server Agent or the SQL Safe Backup Agent for the scheduling of your policy, on this section you have the option to select between SQL Server Agent service account/SQL Safe Backup Agent service account respectively or a Windows account. Click **Account** and select your preferred option.

 The account specified must have read and write privileges on the directory selected for your backup file location.

How do you keep my backups running despite network errors?

Select **Enable network resiliency** and then click **Configure** to change the default settings. By default, SQL Safe will retry the backup operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the backup before stopping the operation.

This option is not available when backing up to tape using Tivoli Storage Manager.

Can you change the default file locations?

SQL Safe automatically populates the path using several available variables, depending on location type. You can modify this path to suit your needs, taking advantage of all the available variables.

For a disk backup, browse for or enter the directory in which to store the backup file. You can use the supplied macros in the way best suited to your storage needs. If you want to limit the lifetime of your backup sets created by the policy, you can select the option that removes files older than

the specified time.

For a TSM backup, browse for or enter the high level directory for the tape file. You can use the supplied macros in the way best suited to your storage needs. Browse for or enter the location of the TSM configuration file.

What does removing old files do?

For backups written to a single file or mirrored files, you can choose to remove old files to prevent disk space limitations. When you select to remove files older than the specified time, backup files created with names of the same format will be deleted from that directory. You can configure SQL Safe to delete old backup files from the primary archive as well as from your mirror archives.

For backups written to a TSM Server, you can configure SQL Safe to mark these files as inactive after a specified age.

How do you mirror the backups this policy creates?

Click **Mirror Archives** , and then specify where you want the mirrored files to be stored.

For each mirror, SQL Safe creates a copy of the backup archive set. You can specify up to 2 mirrors for each backup operation.

Keep in mind that creating mirrors can impact the performance of your backup operation.

If you want to stop the backup operation when mirror location is unavailable , select **Abort backup if a mirror location reports a failure**.

You can also enable to remove files older than a specified time.

What do I specify when backing up to a TSM Server?

When a TSM location is selected, you must specify the following settings:

- high level file path
- low level file path
- the location of the TSM Client configuration file that enables generate password for authorization

You can also configure SQL Safe to mark these files as inactive after a specified age.

SQL virtual database is not available when backing up to a TSM Server.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure schedule

The Schedules tab of the Backup Policy wizard allows you to schedule the frequency and duration of your backup operations. For each backup type, enter the appropriate information into each of the schedule fields to satisfy your backup requirements.

What information is on the Schedules tab?

For each operation you have included in the policy, you can specify when your operation will begin, how frequently backup jobs will be executed, and the respective duration for these operations. You can also choose to run the operation "On Demand," allowing you to easily manually execute the associated jobs according to your preset options.

How do I know what frequency to set?

The schedule of your operations should be determined by how much data you can afford to lose in the event of a catastrophic failure. The schedule should be developed in concert with your [backup strategy](#). For example, for lab or development instances, you may want to schedule on-demand or weekly backups whereas for critical production instances you may want to schedule full backups every day with transaction log backups every hour.

Can I set a different schedule for each backup operation?

Each backup operation can have a different schedule. For instance, perhaps you decide you want to run full backups monthly, differential backups once a week, and transaction logs during business hours every day.

How do I set the schedule?

You can set up a schedule by defining the following options:

Field	Description
Occurs	Unit of Frequency: On Demand, Daily, Weekly, Monthly
Daily Frequency	Time of day: <ul style="list-style-type: none"> Occurs once at HH:MM:SS AM/PM Occurs every N Hours/Minutes starting at HH:MM:SS AM/PM, ending at HH:MM:SS AM/PM
Duration	Length of time: <ul style="list-style-type: none"> Start date mm/dd/yyyy End date mm/dd/yyyy or no end date

 When an operation does not occur as scheduled, the backup policy will consider it "missed" and SQL Safe can notify you about it if you configured it to do so.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Configure notifications

The Notifications tab of the Backup Policy wizard allows you to choose the backup statuses about which you want to receive alert notifications through email. Email notifications let you, and your staff, remotely monitor the status of the backups you have automated with this policy.

The status of the backup operations determine the status of your policy. When your backups are successfully completed on scheduled, the policy is considered ok.

Choose the status you want to monitor, type the email address of each recipient, select the desired alert frequency for each operation, and then click **Next**.

✔ You must configure your mail server settings before SQL Safe can send e-mail notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings for alert notifications](#).

When is the email sent?

SQL Safe sends an email to the specified recipients when the selected operation status occurs. Because SQL Safe checks the status of your backup operations every minute, your alert notifications provide a real-time indication of the health of your service level agreements and disaster recovery plans for the SQL Server instances covered by this policy.

However, how often you are emailed about a specific status update depends on the notification frequency setting you select. For example, if you want to receive an email whenever a backup fails, even when the failures occur sequentially, choose to receive notifications every time the event occurs.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

View the status of all backup policies

When **Backup Policies** is selected in the **Policies** tree pane, the content pane displays information describing the overall status of all of these policies. Use this view to quickly determine whether your servers are in compliance with your corporate backup policies.

What does the Current Status mean?

The **Current Status** displays the most recent, combined status of all operations performed by your backup policies. Even though there are multiple operation statuses, the overall policy status reflects the most critical operation status. When all backups have been completed successfully according to the policy schedule, a green OK icon is displayed.

What is the Last Operation Status?

The **Last Operation Status** shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies.

What is the Operation Summary?

The **Operation Summary** displays a listing of all policies, providing information in the following columns:

Column Header	Definition
Status	Displays either a green OK status bar, a yellow warning status bar, or a red error status bar.
Name	Displays the policy name.
Databases Covered	Displays the number of databases being backed up by the policy.
Last Backup Time	Display the date and time of the most recent backup operation (of any type defined by the policy).
Last Backup Failure Time	Displays the date and time of the most recent backup failure (of any type defined by the policy).

How do you get details about a specific policy?

You can get more details about the status of a specific policy by double-clicking on one of the policy operations in the **Operation Summary** grid or by choosing the respective policy on the Backup Policies folder tree node.

Can you customize the columns in the grid?

You can sort by the content of any of the columns by clicking on the column header.

How do you refresh the operations status?

If a recent operation does not appear in the status view, you can refresh the status of this

pane by clicking the **Refresh** icon in the pane title bar.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View status of a specific backup policy

When a specific backup policy is selected from the Backup Policies tree node, the content pane displays information describing the status of that policy. Use this view to determine which backup operations initiated by the policy have succeeded or failed.

What actions can you perform?

From the Policies tree

By right-clicking on a policy under the Backup Policies node, you can access the following shortcuts:

Action ...	What it does ...
Create Backup Policy	Opens the Backup Policy wizard, allowing you to create a new policy.
Edit Policy	Opens the Backup Policy wizard (with all options pre-set to the values used for this operation), allowing you to edit any of the options.
Delete Policy	Allows you to delete the policy. Although backup operations associated with this policy will no longer be performed, the previous backup files and status messages created by this policy will continue to be stored in the SQL Safe Repository.
Disable Policy	Allows you to disable the selected policy. Backup operations associated with this policy will no longer be performed and will turn off any email notifications you have configured to alert on the backup or restore status.
Start Jobs for Policy	Allows you to run the backup jobs associated with this policy, performing an ad-hoc backup with the options already set by the policy.
Refresh Policy List	Updates the Backup Policies node with the latest policies.

From the Current Status pane

By clicking the links available in the Current Status pane, you can access the following shortcuts:

Action ...	What it does ...
View Policy Settings	Allows you to view a summary of the policy settings.

Edit Policy	Opens the Backup Policy wizard, allowing you to change your policy settings.
Disable Policy	Disables the selected policy. Once a policy is disabled, it will no longer perform backup operations for the associated databases. To back up a database that belongs to a disabled policy, perform a manual backup using the Backup wizard .
Start Full Backups	Performs a full backup of all databases that belong to this policy by running the corresponding job. This action applies your previously defined policy settings, and is only available when your policy includes a full backup operation.
Start Diff Backups	Performs a differential backup of all databases that belong to this policy by running the corresponding job. This action applies your previously defined policy settings, and is only available when your policy includes a differential backup operation.
Start Log Backups	Performs a transaction log backup of all databases that belong to this policy by running the corresponding job. This action applies your previously defined policy settings, and is only available when your policy includes a log backup operation.

From the Operation Summary grid

By right-clicking a backup operation, you can access the following shortcuts:

Action ...	What it does ...
View Details	Shows the Details pane, providing additional information about the selected backup operation such as Statistics, Result text, Files, Backup Set Description, Storage Options.
Back up again	Runs the backup operation again, using the same settings.
Back up with Different Options	Opens the Backup wizard (with all options pre-set to the values used for this operation), allowing you to specify different options before running the operation.

Verify backup	Verifies that the backup file is "good" and can be restored with all data intact.
Restore database	Opens the Restore wizard, allowing you to restore this backup file.
Set Progress To	Allows you to change the status of the selected operation to Complete, Complete, warning, Error, Canceled, Skipped or Deleted.
Close Details	Hides the Details pane.

By right-clicking a verify operation, you can **Verify Again**, **Verify with Different Options** and **Set Progress** to different statuses.

When you select **Verify with Different Options**, the Restore Wizard opens with the Verify option enabled. Use this wizard to set specific settings for this verify operation.

What does the Current Status mean?

The Current Status displays the most recent, combined status of the backup operations performed by this policy. When there are multiple operation statuses, the policy status reflects the most critical operation status. When all backups have been completed successfully according to the policy schedule, a green ok icon is displayed.

What is the Last Operation Status?

The Last Operation Status shows an overview of the most recent backup occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. The operation status is limited to backup operations performed by this policy. Click any backup operation to see more details about it, including the reasons for failed or skipped backup operations if applicable.

What are the Operation Details?

The Operation Details grid displays a listing of all backup and restore operations performed for the databases included in the selected policy for the last 7 days. This grid includes the following columns:

Column	Definition
Progress	During an operation, the progress bar will denote the percentage of the operation completed. When the operation is complete, it will display a green bar labeled 100%. If an operation completed with errors, this column will display a red bar labeled Error.
Instance	Displays the instance name that was backed up by this operation.

Icon	Displays an icon if the backup includes maps containing metadata for InstantRestore and SQL virtual database. For more information about InstantRestore, see How InstantRestore works . For information about SQL virtual database, see Recover objects using SQL virtual database .
Database	Displays the database name that was backed up by this operation.
Operation	Displays the operation performed. The options are Backup and Verify.
Backup Type	Displays the type of the backup performed by the operation. The options are Full, Transaction Log, Differential, and File.
Compressed	Displays the compressed file size of the backup.
Ratio	Displays the percentage of the data that was compressed.
Compression	Displays the type of compression that was used for this backup.
Duration	Displays the number of seconds required to complete the operation.
Start Time	Displays the start date and time of the operation.

Can I customize the columns in the Operation Details grid?

You can sort by the content of any of the columns by clicking the column header.

You can select which columns are visible in this grid, and enable column grouping, by clicking the **Filter** icon in the pane title bar.

How do I refresh the data displayed in the Operation Details grid?

Yes. If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

What are the details?

To see the detailed results of a specific operation, click the operation in the Operation Details grid. The Details pane displays below. By default, this pane is hidden.

The Details pane provides the following information about the selected backup operation:

Tab	Description
-----	-------------

Statistics	Displays the database size, the size of the uncompressed backup, the size of the compressed backup, and the compression ratio achieved with this backup. The ratio is a measure of the storage savings achieved with SQL Safe compression technology. For more information about the storage space savings you can realize using SQL Safe, see Understand your total cost of operation (TCO) .
Result Text	Displays text describing the result of the backup.
Files	Displays the complete path of the backup set file for the backup.
Backup Set Description	Displays the description you specified for this backup.
Storage Options	Displays which locations were chosen to store the backup files.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Log shipping policies

Log shipping policies allow you to ship transaction logs between multiple SQL Server instances in your enterprise, on a scheduled basis. These instances can reside on one or more physical servers.

SQL Safe offers log shipping policies, [backup policies](#), and [Restore policies](#) to address different needs.

What is a log shipping policy?

A log shipping policy consists of primary and secondary databases you want to synchronize, a set of transaction log backup and restore operations to be performed on those databases, and a set of schedules according to which these operations will be performed. You can also choose to mirror the backup files, storing copies of the transaction logs in multiple secured locations. You can then monitor the policy status, all from a single point of contact in the Management Console.

How do log shipping policies help me?

Log shipping policies allow you to implement a disaster recovery strategy for your entire SQL Server environment. You can use log shipping policies to synchronize, or back up and restore, one database to another. Using a log shipping policy to synchronize databases also helps you save disk space and network bandwidth, and comply with security requirements, because each transaction log backup can be compressed and encrypted.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Create a log shipping policy

The SQL Safe Log Shipping Policy wizard allows you to create log shipping maintenance plans across your enterprise. A SQL Safe log shipping policy is defined as a set of primary and secondary databases whose data is synchronized by shipping transaction log backups according to a defined schedule.

How do you access the Log Shipping wizard?

You can access the Log Shipping Policy Wizard from any of the following paths:

- Go to the task bar, click **Create Policy** and then choose **Log Shipping Policy**.
- On the Policies tab, click **Create New Policy** located on the **Operation Summary** section of the **Log Shipping Policies Status** window. This option is only available before you create your first log shipping policy.
- On the Policies tab, right-click the Log Shipping Policies folder and select **Create Log Shipping Policy**.
- From any tab, go to the **File** menu, select **Create Policy** and then **Log Shipping Policy**.

To get started with the Log Shipping Policy wizard:

1. Name the policy.
2. Select the primary database that you want to back up.
3. Specify where these transaction log files should be stored.
4. Select backup options.
5. Select the secondary database you want to synchronize with the primary.
6. Get e-mail notifications about the policy status.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Name the log shipping policy

The General tab of the Log Shipping Policy wizard allows you to specify the basic properties of the log shipping policy.

Why should you specify a name or description?

You are required to enter a unique name for each policy.

Both the name and description will appear in the status messages for your policies. Using a meaningful name and description will allow you to more easily identify problems when they occur. For example, consider specifying a description that will help you later choose the correct backup to restore during a disaster recovery situation.

What options are available for creating a log shipping policy?

When you create a log shipping policy, you can choose between the two following actions:

- Create Backup and Restore Jobs using the SQL Server Agent
- Create Backup and Restore Jobs using the SQL Safe Backup Agent

How does SQL Safe determine that a log shipping policy is okay?

SQL Safe determines that the policy is okay by looking at the following statuses:

- Whether the transaction log backup on the primary database has completed on schedule
- Whether the transaction log restore on the secondary database has completed without warnings or errors
- Whether the data on the secondary database is stable

How do you control when a log shipping policy is compliant?

You can control how SQL Safe determines a missed backup by changing these options:

- Select a time limit for the log backup to occur. This is the leeway time allowed for the log backup to occur. If the log backup occurs within this period from the scheduled time, the policy is still compliant.
- Select an age limit for the secondary's data. This is the tolerance level for how old the data in the secondary database can be.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select the primary database

Use the Primary tab of the Log Shipping Policy wizard to select which SQL Server instance will be the primary source for the log files. This is the database you will be backing up using log shipping.

What information is required on this tab?

SQL Server

The SQL Server that contains the database to be backed up. Select a registered SQL Server or click **Register** to register a new instance.

Database

Select the database from which you will ship the backup logs.

Backup Job

The schedule for how often the backup job will occur. By default, SQL Safe schedules this job to occur every day, every 15 minutes between 12:00 AM and 11:59 PM and to start on the current date. Click **Schedule** to change the frequency and start date.

Backup Options

Click **Backup Options** to change the compression and encryption methods.

The Backup Options window of the Log Shipping Policy wizard allows you to change the methods used for compression and encryption, and the number of threads used when performing a backup.

What types of compression algorithms are available?

- None
- IntelliCompress, optimize for size (iSpeed)
- IntelliCompress, optimize for speed (iSize)
- Levels 1, 2, 3, 4

✔ Backup operations using Level 1 complete fastest but achieve the least amount of compression. Level 4 achieves maximum compression but the backup operation may take longer.

For more information about backup compression and encryption, see [How to choose compression and encryption](#).

What types of encryption algorithms are available?

- None
- AES (128-bit)
- AES (256-bit)

If your SQL Server environment requires FIPS compliance, use the AES encryption option. For

more information, see [Ensure FIPS compliance](#).

When performing a backup, ensure the backup does not truncate the transaction logs of the database. Truncating the log will cause this log shipping policy to fail.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select location for log shipping

The Location tab of the Log Shipping Policy wizard allows you to specify the location for the backups you are creating with this log shipping policy. Backups must be stored to a network path that all servers in the policy can write to.

What options can you set on this tab?

Access Filesystem As

This is the account SQL Safe will use to access the specified primary and mirror locations. Depending whether you selected to use the SQL Server Agent or the SQL Safe Backup Agent for the scheduling of your log policy, on this section you have the option to select between SQL Server Agent service account/SQL Safe Backup Agent service account respectively or a Windows account. Click **Account** and select your preferred option.

 Enter a user account that has access rights to the target locations. The user account used must have read and write permissions to the specified resource.

You can also choose how to handle errors encountered while writing to the network during a backup by selecting **Enable network resiliency**. By default, SQL Safe will retry the backup operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the backup before stopping the operation.

Primary Location

This is the first location where the backup files will be stored. By default, SQL Safe will ship the backup files from this location to your secondary server. When you configure the [secondary database](#) settings, you can specify an alternate location.

Enter the network path or click **Browse** to select the location of where you want the log backup archive to be kept. The destination folder must be configured as a network share.

 SQL Safe detects if the Computer Browser service is not running on your computer. This service enables Windows to list other computers on the network, if this service is not running, Windows may not be able to list the computers on your network. SQL Safe allows you to start this service but keep in mind that it may take several minutes for computers to become visible.

You can also specify how long you want to keep old backup files. By default, SQL Safe will delete files older than three (3) days.

Mirror Locations

These are the locations where copies, or "mirrors", of the backup files will be saved. For each mirror location, SQL Safe creates and stores a copy of the backup files. You can specify up to 2

mirrors for each log shipping operation. Keep in mind that creating mirrors can impact the performance of your log shipping operation.

You can also specify:

- How long you want to keep old backup files. By default, SQL Safe delete files older than three (3) days
- Whether SQL Safe should cancel the backup when one of the specified mirror locations reports a failure, such as connection timeout.

How do you keep your backups running despite network errors?

Select Retry writing backup files after network errors, and then click Configure to change the default settings. By default, SQL Safe will retry the backup operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the backup before stopping the operation.

This option is not available when backing up to tape using Tivoli Storage Manager.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select secondary databases

Use the Secondary(s) tab of the Log Shipping Policy wizard to select the SQL Server instances and databases where the log backups will be restored.

From here, you can add, edit, or remove secondary databases. Each database can be restored with different options, schedule, recovery mode, etc. For more information about adding secondary databases, see [Specify secondary database settings for the log shipping policy](#).

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure secondary options

Use this window to select the SQL Server instances you want to synchronize with the log backups from the primary database.

What options are available in this window?

SQL Server

The SQL Server that contains the database to be restored. Select a registered SQL Server or click **Register** to register a new instance.

Database

Create a new database or select the database that you want to receive the transaction log restores. To create a new database, type directly the database name in the **Database** field. If you want to select an existing database, click **Select** to access the list of databases available on the instance you have selected.

Initialization

Specifies the initial state of the secondary database that receives the transaction log restores. Click **Change** to modify the type of initialization that will be performed.

By default, SQL Safe initializes the database with a newly-generated full backup.

 SQL Safe detects when the primary database was previously configured to use the simple recovery model and requires for a new full backup to be performed to initialize the secondary database for the new log shipping policy. Full backups of a database using the simple recovery model lack log checkpoint information necessary for subsequent log restores.

When you click **Change**, a window for Database Initialization options opens where you can choose:

- Do not initialize. Database exists and has received most recent backup of primary database.
- Initialize database with a newly generated full backup. This will be the only option available when SQL Safe detects that the primary database was previously configured to use the simple recovery model and requires for a new full backup to initialize the secondary database.
- Initialize database with these backups. If you enable this option, you can specify the location of the backups and add encryption settings.

You can also click **Database File Locations** in this window to choose where to store your database files.

Database State

Select the recovery mode the secondary database is left in after each log restore.

This setting affects how the status appears for the secondary database. If you select **Not**

Accessible (No recovery mode) , then the secondary database shows the status as "Restoring" and it is unusable. If you select **Accessible but read-only** (Standby mode) , then the database is in a read-only state. In the latter option, you can choose to disconnect users when performing restore.

Restore Job

This is how often the restore will occur. Click **Schedule** to change the frequency. By default, the restore occurs every 15 minutes every day, but you can specify other settings for your required daily frequency and duration of the job.

You can also choose to delay the restores by a number of minutes or hours. This represents the minimum time within which a secondary can be synced. For example, setting this value to 15 minutes would mean that the secondary will always be at least 15 minutes out of sync.

Restore From

Specify the location that will contain the transaction log backup files you want to restore (ship) to this secondary database.

To use the network path you previously specified for the transaction log backup location, click **Same location as backup**.

To restore from a different location, click **Different location**, and then specify the appropriate network path.

Take into account that to restore from a different location, the database must already be initialized.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure notifications for log shipping

The Notifications tab of the Log Shipping Policy wizard allows you to choose the log shipping statuses about which you want to receive alert notifications through email. Email notifications let you, and your staff, remotely monitor the status of the backups and restores you have automated with this policy.

The status of the log shipping operations determine the status of your policy. When your backups and restores are successfully completed on schedule, the policy is considered okay.

Choose the status you want to monitor, type the email address of each recipient, select the desired alert frequency for each operation, and then click **Next**.

✔ You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings](#) for alert notifications.

When is the email sent?

SQL Safe sends an email to the specified recipients when the selected operation status occurs. Because SQL Safe checks the status of your backup and restore operations every minute, your alert notifications provide a real-time indication of the health of your log shipping policy and your primary and secondary servers.

However, how often you are emailed about a specific status update depends on the notification frequency setting you select. For example, if you want to receive an email whenever a backup fails, even when the failures occur sequentially, choose to receive notifications every time the event occurs.

View status of all log shipping policies

When Log Shipping Policies is selected in the Policies tree pane, the content pane displays information describing the overall status of all of these policies. Use this view to quickly determine whether your servers are in compliance with your corporate log shipping policies.

What does the Current Status mean?

The Current Status area displays the most recent, combined status of all backup and restore operations performed by your log shipping policies. Even though there are multiple operation statuses, the overall policy status reflects the most critical operation status. When all backups and restores have been completed successfully according to the policy schedule, a green okay icon is displayed.

What is the Last Operation Status?

The Last Operation Status shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. Click the status to see more detail about your operations.

What is the Operation Summary?

The Operation Summary area displays a listing of all policies, providing information in the following columns:

Column Header	Definition
Status	Displays either a green Compliant status bar, or a red Non-Compliant status bar.
Name	Displays the policy name.
Databases Covered	Displays the number of databases being backed up by the policy.
Last Operation	Display the date and time of the most recent operation (of any type defined by the policy).
Last Operation Failure	Displays the date and time of the most recent failure (of any type defined by the policy).

How do you get details about a specific policy?

You can get more details about the status of a specific policy by double-clicking the policy operation in the Operation Summary grid.

Can you customize the columns in the grid?

You can sort by the content of any of the columns by clicking the column header.

How do you refresh the operations status?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

View status of a specific log shipping policy

When a specific log shipping policy is selected in the tree pane, the content pane displays information describing the status of that policy. Use this view to determine which backup or restore operations initiated by the policy have succeeded or failed.

What actions can you perform?

From the Log Shipping Policies tree

By right-clicking a policy under the Log Shipping Policies node, you can access the following shortcuts:

Action ...	What it does ...
Create Log Shipping Policy	Opens the Log Shipping Policy wizard, allowing you to create a new policy.
Edit Policy	Opens the Log Shipping wizard (with all options pre-set to the values used for this operation), allowing you to edit any of the options.
Delete Policy	Allows you to delete the policy. Although backup operations associated with this policy will no longer be performed, the previous backup files and status messages created by this policy will continue to be stored in the SQL Safe Repository.
Disable Policy	Allows you to disable of the selected policy. Backup and restore operations associated with this policy will no longer be performed and email notifications configured on these jobs will be turned off.
Re-Initialize Secondary Database	Allows you to re-initialize any of the secondary databases associated with the selected policy.
Refresh Policy List	Updates the Log Shipping Policies node with the latest policies and their statuses.

From the Current Status pane

By clicking the links available in the Current Status pane, you can access the following shortcuts:

Action ...	What it does ...
View Policy Settings	Allows you to view a summary of the policy settings.

Edit Policy	Opens the Log Shipping Policy wizard, allowing you to change your policy settings.
Disable Policy	Disables the selected policy. Once a policy is disabled, it will no longer ship transaction logs to the secondary databases and it will no longer send email notifications configured for the respective jobs.
Start Log Backups	Performs a transaction log backup of the primary database that belongs to this policy by running the corresponding job. This action applies your previously defined policy settings.
Start Log Restores	Performs a transaction log restore on the secondary databases that belongs to this policy by running the corresponding job. This action applies your previously defined policy settings.

What does the Current Status mean?

The Current Status displays the most recent, combined status of the backup and restore operations performed by this policy. When there are multiple operation statuses, the policy status reflects the most critical operation status. When all backups and restores have been completed successfully according to the policy schedule, a green okay icon is displayed.

What is the Last Operation Status?

The Last Operation Status shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. The operation status is limited to the operations performed by this policy.

What are the Operations Details?

The Operation Details graphic provides the following status details for the primary and secondary databases that belong to the selected policy:

Detail	Description
Icons	Indicate whether primary and secondary databases remain compliant with the backup and restore schedules defined by the policy. When compliant, the database icons are marked with a green check and the arrow icons pointing from database to database are green.

State	Indicates whether the database is online or off-line, as well as whether the database is read-only.
Last Backup	Displays the date and time when the last successful backup was performed. This detail displays for the primary database only.
Last Restore	Displays the date and time when the last successful restore was performed. This detail displays for each secondary database.
Latency	Latency measures the amount of time that has elapsed since the last successful restore operation.
Threshold (primary database)	Indicates how much time can elapse before a scheduled backup is considered missed. When a backup is missed, the policy status is non-compliant. You can change the threshold setting by editing your log shipping policy.
Threshold (secondary database)	Indicates how much time can elapse after the last successful restore operation before the database is considered stale. When the database becomes stale, the policy status is non-compliant. You can change the threshold setting by editing your log shipping policy.
Schedule	Displays how often backups are performed on the primary database and how often restores are performed on the secondary databases.

How do you refresh the Operation Details?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Restore policies

Restore policies allow you to define backup maintenance plans across multiple SQL Server instances in your enterprise. These instances can reside on one or more physical servers.

SQL Safe offers [backup policies](#), restore policies, and [log shipping policies](#) to address different needs.

What is a restore policy?

A restore policy consists of a list of databases you want to restore, a source backup archive, and a schedule according to when the restores will be performed. You can then monitor the status of each recurring restore, all from a single point of contact in the Management Console.

How do restore policies help me?

Restore policies allow you to plan and schedule your SQL Server restore maintenance, as well as monitor its success and failures, all from a single point of contact at the Management Console.

Can I select InstantRestore for my restore policy?

No. [InstantRestore](#) is available only when [performing a manual restore](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Create a restore policy

The SQL Safe Restore Policy wizard allows you to create restore maintenance plans across your enterprise. A SQL Safe restore policy is defined as a set of databases for which restore operations will be performed according to a defined schedule. By default, SQL Safe creates the SQL Server jobs for the specified restores.

- ✔ You can create a restore policy for any database that belongs to a [backup policy](#) and has a full backup.

How do you access the Restore Policy wizard?

You can access the Restore Policy Wizard from any of the following paths:

- Go to the task bar, click **Create Policy** and then choose **Restore Policy**.
- On the Policies tab, click **Create New Policy** located on the **Operation Summary** section of the **Restore Policies Status** window. This option is only available before you create your first restore policy.
- On the Policies tab, right-click the Restore Policies folder and select **Create Restore Policy**.
- From any tab, go to the **File** menu, select **Create Policy** and then **Restore Policy**.

To get started with the Restore Policy wizard:

1. Name the policy.
2. Select the source database which contains the data you want to restore.
3. Select the target database where the data will be restored.
4. Get email notifications about the policy status.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Name the restore policy

The General tab of the Restore Policy wizard allows you to specify the basic properties of the restore policy.

Why should you specify a name or description?

You are required to enter a unique name for each policy.

Both the name and description will appear in the status messages for your policies. Using a meaningful name and description will allow you to more easily identify problems when they occur. For example, consider specifying a description that will help you later choose the correct restore operation to monitor during a disaster recovery situation.

What options do you have for creating a restore policy?

When you create a restore policy, you can choose from between the two following options:

- Create Restore Jobs using the SQL Server Agent
- Create Restore Jobs using the SQL Safe Backup Agent

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select the database you want to restore

The Source tab of the Restore Policy wizard allows you to specify the database you want to restore, the location of the corresponding backups, and which account SQL Safe should use to access these files.

To choose the location of your backup, click **Select** and choose one of the locations displayed. SQL Safe will automatically restore the latest backup found in that location each time your restore policy runs.

✔ SQL Safe requires the selected database to belong to a backup policy since it will get the backup file location from a corresponding backup policy for the source database. ***If you choose a database that does not have a backup policy***, SQL Safe will prompt you to create a new backup policy for this database.

How do you keep your restores running despite network errors?

Select **Enable Network Resiliency** and then click **Configure** to change the default settings. By default, SQL Safe will retry the restore operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the restore before stopping the operation. You can change these settings according to your requirements.

What accounts can you specify to access the backup files?

Depending whether you selected to use the SQL Server Agent or the SQL Safe Backup Agent for the scheduling of your restore policy, on this section you have the option to select between SQL Server Agent service account/SQL Safe Backup Agent service account respectively or another account with the respective credentials.

⚠ The specified user account must have read and write privileges on the selected directory for the backup file location.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select the target database

The Target tab of the Restore Policy wizard allows you to specify the database that you want to keep updated with routine restores.

What can you do on this tab?

You can perform the following actions:

- Select the instance where your target database is
- Select the database you want to update using this restore operation
- Specify the location of the data and log files associated with this database
- Choose the appropriate recovery state for the database (Fully Accessible, Accessible but read-only or Not Accessible).
- Schedule when the Backup Agent should execute the restore job
- Select the applicable restore options

How do you change the location of your database files?

If SQL Safe does not display the correct path for the location where you want to restore a file, click **Select** in the Database File Locations section, and then select the proper location.

The Database File Locations window allows you to manage the paths where SQL Safe restores new data files and log files. SQL Safe creates the file name automatically using the file type and destination database name for easy identification.

How do you set the restore schedule?

You can click **Schedule** on the Restore Job option and set the frequency and the duration of your restore policy job.

How do you restore the SQL logins for this database?

You can recover SQL logins associated with this database by selecting the **Restore database logins** option in the Restore options. SQL Safe applies this option when the [source backup files](#) contain login information. To capture login information, [configure your backup policy](#) to include the database logins.

What do you do if your instance is not listed?

If your instance is not displayed in the SQL Server drop-down list, you can choose to add a new instance by clicking the **Register** SQL Server button. For more information, see [Register an instance](#).

What do you do if you have users connected to the database?

You can instruct SQL Safe to disconnect users from the database before performing the restore. To do so, select the **Disconnect users** option from the restore options.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure notifications for restore policy

The Notifications tab of the Restore Policy wizard allows you to choose the restore statuses from which you want to receive alert notifications through email. Email notifications let you, and your staff, remotely monitor the status of the restores you have automated with this policy.

The status of the restore operations determine the status of your policy. When your restores are successfully completed on scheduled, the policy is considered okay.

Choose the status you want to monitor, type the email address of each recipient, select the desired alert frequency for each operation, and then click **Next**.

✔ You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings](#) for alert notifications.

When is the email sent?

SQL Safe sends an email to the specified recipients when the selected operation status occurs. Because SQL Safe checks the status of your restore operations every minute, your alert notifications provide a real-time indication of the health of your service level agreements and disaster recovery plans for the SQL Server instances covered by this policy.

However, how often you are emailed about a specific status update depends on the notification frequency setting you select. For example, if you want to receive an email whenever a restore fails, even when the failures occur sequentially, choose to receive notifications every time the event occurs.

View status of all restore policies

When Restore Policies is selected in the Policies tree pane, the content pane displays information describing the overall status of all of these policies. Use this view to quickly determine whether your servers are in compliance with your corporate restore policies.

What does the Current Status mean?

The Current Status displays the most recent, combined status of all operations performed by your restore policies. Even though there are multiple operation statuses, the overall policy status reflects the most critical operation status. When all restores have been completed successfully according to the policy schedule, a green okay icon is displayed.

What is the Last Operation Status?

The Last Operation Status shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. Click the status to see more detail about your operations.

What is the Operation Summary?

The Operation Summary displays a listing of all policies, providing information in the following columns:

Column Header	Definition
Status	Displays either a green okay status bar, a yellow warning status bar, or a red error status bar.
Name	Displays the policy name.
Databases Covered	Displays the number of databases being restored by the policy.
Last Operation	Display the date and time of the most recent restore operation.
Last Operation Failure	Displays the date and time of the most recent restore failure.

How do you get details about a specific policy?

You can get more details about the status of a specific policy by double-clicking a policy operation in the Operation Summary grid.

Can you customize the columns in the grid?

You can sort by the content of any of the columns by clicking the column header.

How do you refresh the operations status?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View status of a specific restore policy

When a specific restore policy is selected from the Restore Policies tree node, the content pane displays information describing the status of that policy. Use this view to determine which restore operations initiated by the policy have succeeded or failed.

What actions can I perform?

From the Policies tree

By right-clicking a policy under the Restore Policies node, you can access the following shortcuts:

Action ...	What it does ...
Create Restore Policy	Opens the Restore Policy wizard, allowing you to create a new policy.
Edit Policy	Opens the Restore Policy wizard (with all options pre-set to the values used for this operation), allowing you to edit any of the options.
Delete Policy	Allows you to delete the policy. Although restore operations associated with this policy will no longer be performed, the previous status messages returned by this policy will continue to be stored in the SQL Safe Repository.
Disable Policy	Allows you to disable of the selected policy. Restore operations associated with this policy will no longer be performed.
Start Jobs for Policy	Allows you to run the restore job associated with this policy, performing an ad-hoc restore with the options already set by the policy.
Refresh Policy List	Updates the Restore Policies node with the latest policies.

From the Current Status pane

By clicking the links available in the Current Status pane, you can access the following shortcuts:

Action ...	What it does ...
View Policy Settings	Allows you to view a summary of the policy settings.
Edit Policy	Opens the Restore Policy wizard, allowing you to change your policy settings.

Disable Policy	Disables the selected policy. Once a policy is disabled, it will no longer perform restore operations for the associated databases. To recover a database that belongs to a disabled policy, perform a manual restore using the Restore wizard .
Start Restore	Performs a full restore of all databases that belong to this policy by running the corresponding job. This action applies your previously defined policy settings.

From the Operation Summary grid

By right-clicking on an operation, you can access the following shortcuts:

Action ...	What it does ...
View Details	Shows the Details pane, providing additional information about the selected operation.
Restore again	Runs the restore operation again, using the same settings.
Restore with different options	Opens the Restore wizard (with all options pre-set to the values used for this operation), allowing you to specify different options before running the operation.
Set Progress To	Allows you to change the status of the selected operation.
Close Details	Hides the Details pane.

What does the Current Status mean?

The **Current Status** displays the most recent, combined status of the restore operations performed by this policy. When there are multiple operation statuses, the policy status reflects the most critical operation status. When all restores have been completed successfully according to the policy schedule, a green ok icon is displayed.

What is the Last Operation Status?

The **Last Operation Status** shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies. The operation status is limited to restore operations performed by this policy.

What are the Operation Details?

The **Operation Details** grid displays a listing of all restore operations performed for the databases included in the selected policy for the last 7 days. This grid includes the following columns:

Column	Definition
Progress	During an operation, the progress bar will denote the percentage of the operation completed. When the operation is complete, it will display a green bar labeled 100%. If an operation completed with errors, this column will display a red bar labeled Error.
Instance	Displays the instance name that was restored by this operation.
Database	Displays the database name that was restored by this operation.
Operation	Confirms that a restore operation was performed.
Backup Type	Displays the type of backup restored by the operation. Currently, only the recovery of full backups is supported by the restore policy.
Compressed	Displays the compressed file size of the backup used in this restore.
Ratio	Displays the percentage of the data that was compressed in the associated backup.
Compression	Displays the type of compression that was used for the associated backup.
Duration	Displays the number of seconds required to complete the restore operation.
Start Time	Displays the start date and time of the restore operation.

Can you customize the columns in the Operation Details grid?

You can sort by the content of any of the columns by clicking the column header.

You can select which columns are visible in this grid, and enable column grouping, by clicking the **Filter** icon in the pane title bar.

How do you refresh the data displayed in the Operation Details grid?

If a recent operation does not appear in the status view, you can refresh the status of this pane by clicking the **Refresh** icon in the pane title bar.

What are the details?

To see the detailed results of a specific operation, right-click the operation in the Operation Details grid and select **View Details**. The Details pane displays below. By default, this pane is hidden.

The Details pane provides the following information about the selected backup operation:

Tab	Description
Statistics	Displays the database size, the size of the uncompressed backup, the size of the compressed backup, and the compression ratio achieved with this backup. The ratio is a measure of the storage savings achieved with SQL Safe compression technology. For more information about the storage space savings you can realize using SQL Safe, see Understand your total cost of operation (TCO) .
Result Text	Displays text describing the result of the restore.
Files	Displays the complete path of the backup set file for the restore.
Backup Set Description	Displays the description you specified for this restore.
Storage Options	Displays which locations were chosen to store the backup files associated with the restore.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View last operation status

After a policy runs, the Policies tree content pane displays information describing the overall status of all of these operations. The Last Operation Status shows an overview of the most recent backup, restore, or log shipping operations that occurred across your enterprise. Use this view to quickly determine whether your servers are in compliance with your corporate policies.

If your operations are successful, SQL Safe displays a list of these operations and their associated messages. If an operation was unsuccessful for any reason, the Last Operation Status also allows you to rerun the operation from this view instead of requiring you to access the appropriate wizard.

- ✔ You can rerun any previous operation from this grid. To rerun an operation, check the box to the left of the appropriate operation, and then click **Run Selected Operations Again**. This request executes the backup or restore using the previous settings.

What is the operation summary box?

The operation summary box displays a list of all operations for the selected topic, such as Backups were canceled by user. SQL Safe provides information in the following columns:

Column Header	Definition
Instance	Displays the instance name.
Database	Displays the database name.
Operation	Displays the type of operation performed.
Start Time	Displays the start date and time of the most recent operation.

Can I rerun more than one operation?

Yes, you can quickly rerun one or more operations through the Last Operation Status. Check the boxes next to all appropriate operations, and then click **Run Selected Operations Again**. To select all of the displayed operations, check the box next to the Instance column title.

How can I capture the provided information?

SQL Safe allows you to copy the list summary and the related messages using the copy buttons to the left of the operation summary box and the messages box. You can then paste this information in another application, such as Notepad. Use the upper copy button to capture the status, instance, database, operation, and start time. Use the lower copy button to capture the same information, but also include the message.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Perform a Manual Backup

The SQL Safe Backup Wizard allows you to:

- Back up multiple databases on different SQL Server instances
- Back up multiple databases on the same SQL Server instance
- Back up individual databases

SQL Safe executes all of these operations in parallel.

To successfully back up data on a SQL Server instance, SQL Safe requires that you deploy a Backup Agent to the target instance. You can remotely deploy a Backup Agent through the Backup Wizard by registering the target instance.

If SQL Safe detects that your instances is not licensed, go to **License Key Manager** and enable the license for that instance.

-  To back up multiple databases on a routine schedule, use a [backup policy](#) to maintain an up-to-date archives of your databases.

How do you create an archive using the Backup Wizard?

The Backup Wizard guides you through the steps required to archive your database content into backup sets. You can back up a single database, multiple databases, or an entire SQL Server instance.

To create a backup with the Backup Wizard:

1. In the navigation pane, click **Servers**.
2. In the Servers tree, select the SQL Server instance or database you want to backup.
3. Select **Backup Database** from the right-click context menu or click the **Backup** option on the Management Console menu bar. Additionally you can find this **Backup** option on the **File** menu.
4. On the Databases tab, verify that the correct SQL Server instance and databases are selected, and then click **Next** . For more information, see [Select the database to back up](#).
5. On the General tab, select the Backup Type, and select **Create a copy-only backup** or **Verify Backup** if appropriate. Enter a name for the backup and a description. For more information, see [Specify the type of backup](#). Click **Next**.
6. On the Location tab, select the Location Type from **Single File**, **Striped Files** or **Tape** (Tivoli Storage Manager).
7. For any location type, choose to overwrite or append to an existing archive. For more information, see [Select a location for the backup](#) . You can also choose how to handle errors encountered while writing to the network during a backup by clicking **Enable network resiliency**.
8. On the Location tab, you can also set up to two mirror locations for your backup. Click **Next** .
9. On the Options tab, select the appropriate compression and encryption options, and any advanced objects that are appropriate for your environment. For more information, see [Sp](#)

ecify compression and encryption options. *If your SQL Server environment requires FIPS compliance*, use the AES encryption option. Click **Next**.

10. On the Notifications tab, select the email address to which you want to send alert notifications. For more information, see [Configure e-mail notification for the backup](#) .
11. On the Summary tab, review your selections. For more information, see [Review the details of the backup](#).

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select databases for manual backup

The Databases tab of the SQL Safe Backup wizard allows you to specify the instance that hosts the databases, and the specific databases you want to back up.

 If your instance is not licensed, SQL Safe displays a warning message. Go to **License Key Manager** to enable the license for your instance.

What can you do on the Databases tab?

You can select the instance that hosts your target databases.

After you select the instance, the database list is populated. From the database list, select the databases you want to back up.

If you want to ...	Select this option ...
Back up all databases on the selected SQL Server instance	All Databases
Back up only User databases on the selected SQL Server instance	All User Databases
Back up only System databases on the selected SQL Server instance	All System Databases (master, model, msdb, distribution)
Back up only the databases you specify on the selected SQL Server instance	Specific Databases, and then choose the appropriate databases

Why isn't the target instance listed?

The instance list only includes SQL Server instances that have been registered with SQL Safe. If the instance is not in the drop-down list, you can choose to add a new instance by clicking **Register SQL Server**. For more information, see [Register an instance](#).

 You can click **Refresh** to update the list of your databases if you do not see the current information.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select backup type

The General tab of the SQL Safe Backup wizard allows you to specify the backup type, name, and description of the backup you are creating.

What types of backups can you choose?

SQL Safe supports the standard SQL Server database backup types:

- Full Backup
- Differential Backup
- Transaction Log Backup
- File Backup

What should you do for your initial backup?

If you are backing up the database for the first time, select **Full Backup**. A full backup will provide a comprehensive data set, and is required to perform differential backups or transaction log backups later on. For more information about backup types, [Understand backup types](#).

When should you specify a description?

You should provide a description to identify important details about this operation so you can easily identify which backup sets should be restored later. The backup description will appear in the status view of past and current backups, and will allow you to more easily identify problems when they occur.

How do you verify the integrity of your backup?

You can choose to verify the backup. When this option is selected, SQL Safe performs a data integrity check after the backup has been created. SQL Safe only verifies the integrity of the data files in the backup set created by this backup.

Verifying the backup helps identify potential issues that could occur when restoring these data files.

What is a copy-only backup?

A copy-only backup is a copy of the database, not a true backup, and cannot be used as a part of a restore strategy or restore chain. It is a backup that does not affect the log sequence numbers (LSN) of the database.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select location for manual backup

The Locations tab of the SQL Safe Backup wizard allows you to specify the backup location you want to use to store the backup set. For a TSM backup, you can change the TSM connections settings to override the values set in the client options file if you need to write the backup files to a TSM Server other than the TSM Server already specified in the dsm.opt file.

What information is on the Locations tab?

You can select the location type and the UNC or full path of an existing archived backup set.

What do you do if you don't have an existing archive file?

If you do not have an existing archive file, SQL Safe creates a new archive file that includes this backup set, using the name you specified.

What do you do if you do have an existing archive?

You can **Append** to an existing archived backup set or choose to **Overwrite** it.

How do you specify a UNC path?

To specify a UNC, type the UNC path directly in the field. You cannot specify a UNC when using the browse option.

 Using a UNC path allows you to restore backups to a different or new server from the original archive.

Where can you store your backup set?

SQL Safe supports the following location types:

- Single File
- Striped Files
- Tape (using Tivoli Storage Manager)

What actions can you take with the location types?

Location Type	Action
Single File	Enter the name of the backup archive.
Striped Files	Enter as many backup archive names as the number of striped files you want. When backing up SQL Server 2000 databases, consider using as few striped files as possible since a high number of striped files can significantly degrade performance due to SQL Server memory allocation.
Tape	Enter the path of the TSM configuration file and the Object Name.

What are striped files?

If you want to take advantage of distributing I/O overhead for a large database, select striped files, and select backup locations on different local disks.

When backing up SQL Server 2000 databases, consider using as few striped files as possible since a high number of striped files can significantly degrade performance due to SQL Server memory allocation.

How do you handle errors encountered while writing to the network during a backup?

Click **Enable Resiliency** and access the **Network Resiliency Settings** window where you can specify how often you want to retry when errors occur and after how much time the operation will fail. You can also configure how much time is allowed for the total retry time of the backup.

How do you mirror your backups?

Click **Mirroring Archives**, and then specify where you want the mirror copies to be stored.

For each mirror, SQL Safe creates a copy of the backup archive set. You can specify up to 2 mirrors for each backup operation. Keep in mind that creating mirrors can impact the performance of your backup operation.

If you want to stop the backup operation when the mirror location is unavailable, select the corresponding option.

How do I keep my backup running despite network errors?

Select **Retry writing backup files after network errors**, and then click **Configure** to change the default settings. By default, SQL Safe will retry the backup operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the backup before stopping the operation.

This option is not available when backing up to tape using Tivoli Storage Manager.

What do I specify when backing up to a TSM Server?

When a TSM location is selected, you must specify the following settings:

- high level file path
- low level file path
- the location of the TSM Client options file that enables generate password for authorization

You can change the TSM connections settings to override the values set in the client options file. You can also configure SQL Safe to mark these files as inactive after a specified age.

 Note that SQL Safe accepts up to 260 characters for the TSM file path name.

Can I store backup files in a different TSM Client file space?

Yes. Under **TSM Client Settings**, specify the name of the node you want to use and the password required to access the node.

What settings can I change in the TSM Client options file?

Click **Change** to specify the node name, the password required to access the node, and the TCP/IP Server address and port.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure options for manual backup

The Options tab of the SQL Safe Backup wizard allows you to select additional options, such as compression and encryption, to use for the current backup operation.

What types of compression algorithms are available?

- None
- IntelliCompress, optimize for size (iSize)
- IntelliCompress, optimize for speed (iSpeed)
- Levels 1, 2, 3, 4

✔ A backup operation using Level 1 completes fastest but achieves the least amount of compression. Level 4 achieves maximum compression but the backup operation may take longer.

For more information about backup compression, see [How to choose compression and encryption](#).

What types of encryption algorithms are available?

- None
- AES (128-bit)
- AES (256-bit)

If your SQL Server environment requires FIPS compliance, use the AES encryption option. For more information, see [Ensure FIPS compliance](#).

Does encryption require a password?

When you choose to encrypt an archive, you must designate a password. For security reasons, SQL Safe does not store this password. Ensure you remember the password you select.

What are the advanced options?

The following options are available as Advanced Options:

Options	Description
Number of threads	Allows you to specify how many threads you want SQL Safe to use to distribute the backup operation across multiple processors on the target SQL Server computer. Use this setting to optimize backup performance. Select Auto to have SQL Safe determine the optimal thread count for your environment.
Remove inactive transaction log entries	Removes all completed transactions from the transaction log after SQL Safe finishes the backup. This option is only available for Log backups

Generate maps	Generates maps containing metadata for each database included in your backup file. Depending on the number of transactions completed since your last backup, generating maps may impact the performance of the backup operation. Generating maps is optional, but must exist in the backup file for InstantRestore to accept and restore that file. SQL virtual database can attach SQL Safe backup files without the metadata, but the data files improve SQL vdb performance during creation of the virtual database. For more information, see Recover objects using SQL virtual database . This option is selected by default.
Include database logins in backup file	Copies SQL login information for the selected databases, including credentials and privileges, when the backup files are written. To help ensure the security of your SQL Server database, SQL Safe encrypts the login information. This option is available for full backups only.

What are the advanced options for SQL Server 2005 and later?

The following options are available as Advanced Options for SQL Server 2005 and later:

Options	Description
Generate checksums	Generates a checksum for the backup file.
Ignore checksum errors	Select this option to ignore any errors from the generated checksum. <i>If checksum errors are encountered</i> , this option indicates that SQL Safe should continue to back up this database.
Read-write filegroups	Specifies a partial backup, which includes the primary filegroup and any read-write secondary filegroups. Read-write filegroups are not supported by SQL virtual database. <i>If this option is selected</i> , the Generate metadata option will be disabled. Additionally, backups created with the read-write filegroups option cannot be used by SQL virtual database to create virtual databases.

What does the option Generate Script do?

You can generate a T-SQL or CLI script that will execute the backup you have defined in the

wizard. For more information about generating scripts, see [How script generation works](#).

What do you do next?

After you complete the Options tab, you can click **Next** to continue with the Backup Wizard, select any previously visited tab to modify that information, or click **Generate Script** to create a T-SQL or CLI script.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure notifications for manual backup

The Notifications tab of the SQL Safe Backup wizard allows you to email a status notification to the appropriate database administrators about this backup. Email notifications let you, and your staff, remotely monitor the status of your backups.

Choose the status you want to monitor, type the email address of each recipient, and then click **Next**.

✔ You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings for status notifications](#).

When is the email sent?

SQL Safe sends an email to the specified recipients only when the selected backup status occurs. For example, if you chose to monitor whether the backup fails, you will not be emailed if the backup is skipped. Because you are performing a manual backup, you will receive one status notification.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Review details for manual backup

The Summary tab of the SQL Safe Backup wizard provides the summary of specified values and options you have selected in the Backup Wizard.

What do you do next?

After you have reviewed the information on the Summary tab, click **Backup** to submit the backup job immediately, or click **Generate Script** to create a script you can use to run the job at a later time. For more information about generating scripts, see [How script generation works](#).

How do you verify the status of your backup?

If you chose to run the backup job immediately, and want to verify a successful run, you can view its status using the **Instance View**. For more information, see [View backup/restore operation status](#).

What actions can you perform on the Summary tab?

Action	Steps
Immediately backup databases	Click Backup , and then highlight the instance or database in the tree pane to see the status of the operation.
Create a CLI backup script	Click Generate Script , and then click Command Line . To Save the script to a file , click the saving icon or the Copy script to clipboard icon respectively. SQL Safe creates a backup script using the settings you specified for the selected databases. You can use this script to perform future backups of any system or user database you selected. Click Close to return to the Backup Wizard.
Create a T-SQL backup script	Click Generate Script , and then click T-SQL . To Save the script to a file , click the saving icon or the Copy script to clipboard icon respectively. SQL Safe creates a backup script using the settings you specified. You can use this script to perform future backups of any system or user database you selected. Click Close to return to the Backup Wizard. This script requires the SQL Safe XSP. For more information on installing the SQL Safe XSP, see Deploy the SQL Safe XSP . For more information about how to use the SQL Safe XSP, see the sample scripts available from the Programs menu.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Perform a Manual Restore

SQL Safe allows you to restore multiple databases or files to any SQL Server instance you have registered. Ensure each registered instance is running the SQL Safe Backup Agent. Depending on your needs, you can restore databases from specific backup sets, or use the intuitive user interface to select specific points in time for each database you want to restore. When you select a time, SQL Safe automatically selects the appropriate backup sets that contain the data to be restored.

The Restore wizard will walk you through the restore process. Use the following checklist to ensure you have everything in place to restore your databases to the correct locations and to the correct points in time.

<input checked="" type="checkbox"/>	Follow these steps ...
<input type="checkbox"/>	Determine the location of the databases you want to restore to the SQL Server instance in question.
<input type="checkbox"/>	Determine which SQL Server instance should host the recovered databases.
<input type="checkbox"/>	For each database you need to recover, decide whether you will be restoring data from a specific backup set, or if you will restore data to a specific point in time. you can select the specifics in the Restore wizard.
<input type="checkbox"/>	Determine whether you want and are able to use InstantRestore .

 To restore a database on a routine schedule, use a [restore policy](#) to maintain an up-to-date copy of your database.

What does the Restore wizard do?

The SQL Safe Restore wizard allows you to simultaneously restore multiple databases on different SQL Server instances, restore multiple databases on the same SQL Server instance, or restore individual databases. SQL Safe also allows you to verify the integrity of a backed up database without restoring it.

What is InstantRestore?

InstantRestore allows you to quickly come back on line while restoring your database. It is important to understand InstantRestore fully before undertaking this type of database restore. Make sure you know the supported restore information before attempting to use the InstantRestore feature. Note that InstantRestore supports only complete database restores and does not support file or filegroup restores.

How do I restore a backup using the Restore wizard?

1. In the navigation pane, click **Servers**.

2. In the Servers tree, select the SQL Server instance or specific database you want to restore.
3. Select the appropriate restore operation (**Database (s)** or **Database (s) Files**) from the right-click context menu, the **Restore** option on the Management Console menu bar, or go to the **File** menu and look for the **Restore** option.
4. On the Target tab, choose the instance to which you want to restore the database. You can disconnect any users before you restore the database. For more information, see [Select the instance to restore](#). On this section, you can also choose to verify the integrity of a backup up database instead of restoring it. On the Advanced Options, you can select the number of threads for decompressing data. After making you choices, click **Next**.
5. On the Databases tab, select the database or backup file you want to use for the restore. If you want to restore a backup that has moved or has no history, you can still select it using one of the file system tabs (Repository, File System, Target Server, TSM). For more information, see [Select the database you want to restore](#). Click **Next**.
6. On the Backup Sets tab, for each database you have chosen to restore, select either the time to restore to or the backup set to restore from. On this section you can also configure options for encryption settings, editing file paths, and enabling network resiliency options. For more information, see [Select a backup set for the restore](#). Click **Next**.
7. On the Database Files tab, configure the appropriate settings for each database you are restoring. On this section you can verify the database name and data file locations. For more information, see [Enter the database files for the restore](#).
8. Click **Next**.
9. On the Recovery State tab, select the appropriate recovery state for each individual database (Fully accessible, Not accessible, Accessible but read-only). For more information, see [Choose the recovery state for the restore](#).
10. Click **Next**.
11. On the Restore Type tab, select the appropriate restore type. You can select from normal SQL Safe restore or InstantRestore. For more information, see [Choose the type for the restore](#).
12. On the Notifications tab, select for which events to receive notifications about and specify the email addresses of those who will receive these notifications. In order for SQL Safe to send email notifications, you must configure your mail sever settings first. For more information go to [Configure e-mail settings](#).
13. On the Summary tab, review your selections. For more information, see [Review the details of the restore](#).
14. Click **Restore**.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How InstantRestore works

SQL Safe InstantRestore is a powerful new restore technology that allows you to bring a database online quickly while the restore occurs in the background. SQL Safe enables the SQL Server to immediately begin the transactional part of a database restore, deferring the data file (MDF) restoration until after the database is online. SQL Server continues to handle all transaction log (LDF) restoration activity.

When the restore process is complete and the database is online, SQL Safe takes over and restores the remaining data to the data files in the background. If SQL Server needs data not yet restored, SQL Safe delivers the data to SQL Server directly from the backup. Because SQL Safe never interferes in the SQL Server log operations, ACID (Atomicity, Consistency, Isolation and Durability) compliance for your databases is not affected. When SQL Safe completes data file restoration, it removes itself from all I/O activity of the database and leaves behind a database identical to one restored with a traditional restore process. As a result, SQL Safe is no longer required to access the database.

✔ You cannot use the InstantRestore feature on any version of the Windows 2000 operating system and Microsoft SQL Server 7.

✔ Beginning with version 7.0, SQL Safe includes a mini-filter driver to support the InstantRestore feature. The driver, named SQL SafeFilterDriver, allows SQL Server to access database data while SQL Safe is performing an instant restore. The driver is only used during an instant restore and is no longer necessary once the database is completely restored.

How to enable InstantRestore

You first must enable the InstantRestore feature. Because some users may feel uneasy installing a device driver on their systems, InstantRestore is disabled by default. You can enable or disable the InstantRestore feature quickly depending on what task you are performing:

- ***If you are viewing your SQL Server instances in the Servers tree***, right-click the instance you want to restore, and then select **Enable SQL Safe InstantRestore** or **Disable SQL Safe InstantRestore**.
- ***If you are in the SQL Safe Database Restore wizard***, complete the wizard up to the Restore type tab where you will find the option for enabling InstantRestore.

⚠ If an InstantRestore operation is in progress when a user attempts to disable these components, SQL Safe displays a warning message.

Eligible backups

The InstantRestore feature is available for only a database backup that is:

- **A SQL Safe backup archive with backup metadata (maps).** Because InstantRestore allows SQL Server to immediately access the data in a backup, the process needs

additional information about the backup which is not present in a native backup file. Please note that this information is also missing in SQL Safe backups that are written directly to Tivoli Storage Manager (TSM).

- **A complete database restore.** InstantRestore can restore a database using any normal restore chain starting with a full backup. InstantRestore does not support partial restores such as file restores or restoring a database with the NO RECOVERY or STANDBY options.

Monitoring your instant restores

As SQL Safe performs an instant restore, you can monitor its progress using the SQL Safe Management Console or via alerting. InstantRestore is a new type of restore operation and appears in the Management Console status grid like traditional backup or restore operations.

The InstantRestore operation is tracked with the following two operation types:

InstantRestore

The InstantRestore operation tracks the progress of the entire database restore process. The progress bar increments to 100% for the initial restore progress until the database comes online. When the initial restore completes and the database is online, the status changes to **Online** and the cell changes to light green. SQL Safe then displays a new line for the Hydrate operation.

Hydrate

The Hydrate operation tracks the progress of the background restore process. The progress bar increments to 100% for the background restore progress until the restore is complete. When the database restore is complete, the status of both the InstantRestore and Hydrate operations changes to **Complete** and the cell changes to dark green.

Instant Restore operations include the following two statuses to indicate important milestones of the operation:

Online

The Online status indicates that the database is online and ready for use.

Halted

The Halted status indicates that an event interrupted the InstantRestore process. A network issue between SQL Safe and the backup archive can interrupt an instant restore. Because InstantRestore allows changes to the database while the restore is occurring, the database is not deleted if an issue occurs during Hydration. If such an event occurs, the database transitions to a read-only state to prevent the system and users from writing additional data to the database. At this point, you can restore access to the backup archives and the instant restore can safely resume.

Handling errors during Hydration

If the hydration process is interrupted for any reason:

- The InstantRestore and Hydration operations transition to the Halted state.
- SQL Safe displays an error message stating that hydration is interrupted.

If an error occurs during the InstantRestore operation prior to the beginning of the Hydrate

process, SQL Safe displays only the InstantRestore operation with an error status, and includes the error message for the failure.

- ✔ The InstantRestore operation has two phases. In the first phase, the T-SQL restore command runs and after the database is online, hydration starts. If an error is encountered in the first phase (i.e. the T-SQL restore command) and the database remains in SQL Server, SQL Safe does not delete the database.

SQL Safe includes the following failure scenarios that may occur during an instant restore.

Component	Failure	Resolution
Server	Crashes	If the server suffers a catastrophic crash and is no longer available, no recovery is available.
Server	Reboots	If the server reboots because of a power failure, automatic software update, or other similar situation, and comes back online correctly, the SQL Safe Filter Service restarts and then resumes hydration.
Server	Runs out of resources	<p>If the server runs out of memory or other resources, and the SQL Safe Filter Service cannot allocate the additional resources during hydration, SQL Safe uses the following steps:</p> <ol style="list-style-type: none"> 1. <i>If the offending process is identified :</i> <ol style="list-style-type: none"> a. The user must stop the process. b. The user can manually restart the SQL Safe Filter Service (if stopped). c. If hydration does not resume once the SQL Safe Filter Service restarts, the user can manually restart the operation. 2. <i>If the offending process is not identified ,</i> the user may reboot the server.

Server	Suffers a disk failure	If the database or InstantRestore support files is corrupted by a disk failure, no recovery is available.
Service	Restarts	<p>If one or all of the following items restarts, hydration should resume after the restart is complete:</p> <ul style="list-style-type: none"> • SQL Server • SQL Safe Backup Agent • SQL Safe Filter Service <p>If the database did not go into Suspect mode during this process, hydration resumes from the point where it left off when the SQL Safe Filter Service restarted.</p> <p>If the database is in Suspect mode, the SQL Safe Filter Service brings the database out of Suspect mode, and then resumes hydration.</p>
Filter Service	Crashes	<p>If the SQL Safe Filter Service crashes, hydration resumes once the service restarts.</p> <p>If the SQL Safe Filter Service crashes again, you may need to recover any new data added since the first crash.</p>

Backup file	Is corrupt	<p>If the backup file is corrupt or there is a read problem when accessing the network, the SQL Safe Filter Service fails to decompress during hydration.</p> <p>If the backup file is corrupt, and you have another copy of the backup file, you can restart hydration using the non-corrupt backup file. If the issue is a read problem when accessing the network, you can restart hydration once you address the network issue.</p>
Backup file	Is inaccessible due to a network failure	<p>If the backup file is inaccessible due to a network failure, InstantRestore attempts a retry. If the retry fails, and the maximum retry attempts is reached, the Hydration operation status transitions to the Failure state. Once you correct the network issue or relocate the backup file, you can resume hydration. If the Hydration fails, you may need to restart InstantRestore.</p>
Backup file	Is inaccessible due to a lack of access permissions	<p>If the SQL Safe Filter Service restarts and is unable to open the backup file because the account attempting to read the file does not have the proper permissions, you must provide the account permission, and then resume hydration.</p>

Does SQL Safe include new characteristics specific to the InstantRestore feature?

Yes, there are new details in SQL Safe to support InstantRestore. For supported platforms, the following components were added to SQL Safe to support InstantRestore:

SQL Safe Filter Service (SQL SafeFilterService.exe)

The SQL Safe Filter Service is responsible for handling I/O requests from SQL Server and

performing the background database restore (hydration).

SQL Safe Filter Driver (SQL SafeFilterDriver.sys)

The SQL Safe Filter Driver is responsible for intercepting I/O requests for databases that have active InstantRestore operations under way. When an instant restore completes the driver totally disengages from all I/O activity of the database and is no longer needed. This device driver utilizes the Microsoft mini-filter driver technology.

Do you have to use the console for InstantRestore?

No, the Console is not the only place where you can use the InstantRestore feature. You can execute an InstantRestore via T-SQL script using either the SQL Safe CLI or XSP commands. To use the XSP InstantRestore command, see the sample XSP scripts available from the Programs menu.

Example CLI code snippets that use the InstantRestore command

You can also perform an instant restore through the CLI. Additional options can be set in the SQL Safe Restore wizard, from which you can generate a CLI script that includes the specified wizard settings.

```
SQL SafeCmd.exe InstantRestore <database> <full_backup> -diff
<diff_backup> -log <log_backup>
```

The following three options are specific to a backup set:

- BackupFile (if the backup set is striped)
- BackupSet
- Password (or EncryptedRestorePassword)

Where these options appear in the command determines to which backup set they are applied. When you encounter one of these options, it is applied to the full if no -Diff/-Log option is yet encountered, otherwise it is applied to the most recent -Diff/-Log. For example, if you want to instantly restore the following backups:

- Full backup, 2 stripes, backupset 2, encryption key "full"
- Diff backup, 2 stripes, backupset 3, encryption key "diff"
- Log backup, 2 stripes, backupset 4, encryption key "log"

Use the command:

```
SQL SafeCmd InstantRestore Northwind "C:\Backup\Northwind_Full (1 of
2).safe" -BackupFile "C:\Backup\Northwind_Full (2 of 2).safe"
-BackupSet 2 -Password "full" -Diff "C:\Backup\Northwind_Diff (1 of
2).safe" -BackupFile "C:\Backup\Northwind_Diff (2 of 2).safe"
-BackupSet 3 -Password "diff" -Log "C:\Backup\Northwind_Log (1 of
2).safe" -BackupFile "C:\Backup\Northwind_Log (2 of 2).safe" -BackupSet
4 -Password "log"
```

For more information about available instant restore options, see the usage statements in the CLI Help.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select target instance for restore

The **Target** tab of the Restore wizard allows you to select the SQL Server instance where you want to restore the database(s). In this section you can follow these steps:

1. Select from the drop-down list the SQL Server instance where you want to restore your database(s). If your instance is not displayed, register it by using the [Add Instance Wizard](#).
2. Choose one of the following actions:
 - **Restore** - select this option to restore your databases. You can select the option **Disconnect users before restore** to instruct SQL Safe to disconnect users from databases before performing the restore operation.
 - **Verify** - this restore option helps you ensure your backup operations are successful without actually restoring your data. Consider using this restore verification option on all critical backups after executing the backup operation.

What other Advanced Options do you have on this section?

You can specify the number of threads for compressing data or you can choose the **Auto** option so that SQL Safe calculates the optimum number of threads for your operation.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select the databases you want to restore

The Databases tab of the Restore wizard allows you to specify the databases you want to restore and the general location of the corresponding archive files. You can select:

- Whether the backup file resides in your repository. Choose the SQL Server where the database(s) to be restored were backed up, then select the Databases you want to restore.
- Whether the archive file was written to the local File System. Enter a file from the network share or local drive. This path must be accessible by the Backup Agent installed on the Agent Computer.
- Whether a network share is available on a remote file system (Target Server)
- Whether the backup was performed using TSM

When restoring from a TSM Server, browse for the correct database archive. You can change the TSM connections settings to override the values set in the client options file.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select the backup set for the restore

The Backup Sets tab of the Restore wizard allows you to choose which backup sets you want to use to restore the selected databases.

What information is on the Backup Sets tab?

For each database you have selected to restore, the backup set listing is populated with the available backup sets from the Repository. You can choose the specific backup sets you want to restore, or you can select a point in time to which you want to restore data. To restore more than one database, select a backup set for each database.

 If your backups have been done locally in a server that is different from the the restore server, you may need to specify manually the location of these backup sets.

What do you do on the Backup Sets tab?

For each database you are restoring, you can choose one of three methods to select the appropriate backup sets:

- Time slider
- Manual selection of a specific point-in-time
- Manual selection of the backup set

What is the benefit of using the point-in-time slider?

When you select a point in time by clicking in the time slider, the corresponding backup sets are automatically selected. This ensures you are using the appropriate backup sets and files to restore the data you need. SQL Safe does not restore data time-stamped with dates later than the point in time you specify.

How do you use the point-in-time slider?

Depending on where you click, you can control which backups are used in this restore.

Click location	Result
Within a full backup marker	Selection of the full backup set.
Within a differential backup marker	Selection of the last known full backup, as well as the differential backup.
Above a transactional log marker	Slider snaps to the end of that log file and you will select the last known full backup and the entire transactional log file.
Within a transactional log marker	Selection of the last known full backup and all the transactions up to the specific point-in-time you clicked on.

 You can set the amount of information displayed on the point-in-time slider by choosing information from the Last 30 days, Last 14 days, Last 7 days, Yesterday & Today, Today, and Custom Date Range.

Why would you select a specific point-in-time instead of using the slider?

Because the precision of the slider may not suit your needs, you can manually enter the specific point in time to restore in the **Selection Options**. This automatically selects the appropriate backup sets while providing pin-point time accuracy.

How do you manually select backup sets?

You can also choose to manually select which backup sets to restore. If you choose this option, you must also select the specific backup set to restore. To pick specific backup files, click the Backup Files from the list of Backup Set Names.

How do you select where your backup files are located?

Click **Edit File Paths** to display a list of backup files that you can use to restore the selected backup set. The Backup File Locations window displays the list of backup files SQL Safe uses to restore your backup sets. By clicking on the filename, you can edit it. You can also edit the path by clicking the button to the right of the path you want to change. Mirrored files also appear in the dropdown list if available. Click **OK** to apply your changes.

What are the encryption settings?

The option for **Encryption Settings** will be available when you choose a backup set where you have used the encryption option during its backup. Use this option to access these encryption settings.

How do you keep your restores running despite network errors?

Select **Enable network resiliency**, and then click **Configure** to change the default settings. By default, SQL Safe will retry the restore operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the restore before stopping the operation.

Why is the Generate Script button enabled?

You can generate a T-SQL or CLI script that will execute the restore operation with the settings you have defined in this wizard. For more information about generating scripts, see [How script generation works](#).

How do you use a mirrored file?

In some situations, SQL Safe creates a mirrored version of a backup file. You can use this file when the database you want is mirrored, and you cannot find the original because it was moved or deleted.

When SQL Safe tests file paths for a restore, and does not find the information it is looking for, a dialog box opens asking if you want to choose the same path and try again, or if you want to choose a different location for these files. If you choose to find a different path, SQL Safe displays the path of the failed file and allows you to choose another location. SQL Safe displays an icon to the left of the file name that alerts you of any file that failed the access test. Select the appropriate path, and then click **OK**.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Specify a file name and location

The Database Files section of the Restore wizard allows you to rename a database by changing the name or move the location by editing the data file locations of the restored files.

What information is on the Database Files tab?

For each database you have selected to restore, you are required to specify the name for the restored database, and the filename to which you will restore the database.

What do I do on the Database Files tab?

For each database you are restoring, you have several ways to select the restored database name and path. You can:

- Select target database from drop-down list of existing databases
- Enter a new database name
- Enter a new database path
- Select restore options for these files
- Edit the filename of the restoring file

When you select a database name from the drop-down list, or edit the field, the **Restore As Filename** is automatically updated to reflect the new name, but you can edit this field by directly typing on the grid. You can also change the database path by simply editing the filename in the grid.

What actions can I perform on the Database Files tab?

Action	Steps
Create a new database to restore.	Type a new database in the Restore As text box.
Change the path of the target database	Enter a new path in the Change path field.
Ensure the selected backup files are restored, even if that means overwriting an existing database.	Select the Force Restore option (replace).
Restore the SQL logins associated with the selected databases	Select the Restore database logins option. This option is available when you are restoring a full backup that contains the database login information.
Ignore any errors from the generated checksum. <i>If checksum errors are encountered</i> , SQL Safe should continue to restore the backup file.	Select the Ignore checksum errors option.
Retain the settings used when the selected databases were replicated.	Select the Preserve replication settings option.

Can I overwrite an existing database?

To restore a database over an existing database, select the **Force Restore** option to ensure

SQL Safe writes the selected backup files over the existing database.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select recovery state

The Recovery State tab of the Restore wizard allows you to choose the recovery state each database should be left in after the restore.

- ✔ Fully accessible is the only recovery state supported by the InstantRestore feature. If you choose a partial recovery state, you cannot restore your database using InstantRestore. For additional information about performing an InstantRestore, see [How InstantRestore works](#).

Which recovery states are supported?

SQL Safe supports the following recovery states:

- **Fully Accessible.** Leaves the database operational. No additional transaction logs can be restored. Note that you must use this fully-operational recovery state to use InstantRestore.
- **Not Accessible** (no recovery mode). Leaves the database non-operational, but able to restore additional transaction logs.
- **Accessible but read-only** (standby mode). Leaves the database read-only and able to restore additional transaction logs. You can specify an **Undo file** for this option.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Select restore type

The Restore Type section of the Restore wizard allows you to choose whether you want to use the [InstantRestore](#) option when restoring your database.

InstantRestore is not available for all restores as not all properties are supported; for example, you cannot restore a SQL Safe backup from a TSM Server. Also note that InstantRestore supports only complete database restores and does not support file or filegroup restores. Additionally, InstantRestore can only work when you choose a Fully Accessible recovery state.

What is the benefit of using InstantRestore?

In most cases, InstantRestore allows you to use the database almost immediately after starting the restore. If you have large databases that you need to access very quickly, this may be the best option for you, but take into account that there may be some performance issues if your users are making changes to the database while the restore is in progress.

InstantRestore will bring the database online quickly allowing you to access your data while SQL Safe continues to restore the database in the background.

What options do you have available on this section?

You can choose between a Normal SQL Safe Restore and a SQL Safe InstantRestore. If you choose the first one, SQL Safe will restore the database using the traditional restore engine and the database will become available when the restore completes. If you choose the InstantRestore option, the database will become available in a fraction of the time that a normal restore normally takes.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configure notifications for manual restore

The Notifications section of the Restore wizard allows you to email a status notification to the appropriate database administrators about the restore operation. Email notifications let you, and your staff, remotely monitor the status of your restores.

Choose the status you want to monitor, type the email address of each recipient, and then click **Next**.

✔ You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings for status notifications](#).

When is the email sent?

SQL Safe sends an email to the specified recipients only when the selected restore status occurs.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Review details for manual restore

The Summary tab of the restore wizard provides the summary of specified values and options you have selected in the Restore Wizard.

What do I do next?

After you have reviewed the information on the Summary tab, click **Restore** to submit the restore job immediately, or click **Generate Script** to create a script you can use to run the job at a later time.

If you choose to run the restore job immediately, and want to verify a successful run, you can view its status in the Instance view. For more information, see [View backup/restore operation status](#).

What actions can I perform on the Summary tab?

Action	Steps
To immediately restore databases	Click Restore , and then highlight the instance or database in the tree pane to see the status of the operation.
To create a CLI restore script	Click Generate Script , and then click Command Line . To save the script to a file, click the save icon or the copy script to clipboard icon. SQL Safe creates a restore script using the settings you specified for the selected databases. You can use this script to perform future restores of any system or user database you selected. Click Close to return to the Restore Wizard.
To create a T-SQL restore script	Click Generate Script , and then click T-SQL . To save the script to file, click the save to a file icon or the copy script to clipboard icon. SQL Safe creates a restore script using the settings you specified. You can use this script to perform future restores of any system or user database you selected. Click Close to return to the Restore Wizard. This script requires the SQL Safe XSP. For more information on installing the SQL Safe XSP, see Deploy the SQL Safe XSP . For more information about how to use the SQL Safe XSP, see the sample scripts available from the Programs menu.

How do I verify the status of my restore?

If you want to verify that your restore operation successfully ran, you can view its status using the Instance view. For more information, see [View backup/restore operation status](#).

Report on Backup and Restore Operations

SQL Safe Reports (Reports) provides several built-in reports that allow you to quickly and access backup and restore information. Each report gives detailed information about backups and restores performed by SQL Safe.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Available reports

You can generate any of the following reports. These reports help you better understand and track backup and restore operations, such as measuring the performance of individual backups or monitoring storage consumption. Use these reports to proactively identify and meet the needs of your changing SQL Server environment.

SQL Safe – Backup Owners

This report lists the backups and associated owners for all SQL Server instances and databases registered with SQL Safe. Use this report to monitor backup activity and enforce database security. For example, you can verify that the appropriate database administrators are executing backup operations on the databases they own.

SQL Safe – Backup Performance

This report provides backup performance statistics for the selected SQL Server instances and databases. Use this report to track and compare backup performance.

SQL Safe – Backup Size Chart

This report charts SQL Safe backup sizes for a specific database over time. Use this report to track how the backup size for a particular database has changed.

SQL Safe – Backup Store Utilization

This report indicates how much backup storage space is currently used by the selected SQL Server instances and databases.

SQL Safe – Large Backup

This report lists any SQL Safe backup that is larger than the specified size. Use this report to identify backups that could compromise storage policies.

SQL Safe – Last Backup

This report provides details about the last database backup executed on the selected SQL Server instances and databases. Use this report to monitor or troubleshoot recent backup operations.

SQL Safe restored databases

This report provides details about all database restore activity that occurred in a given date range. Use this report to track restore operations across your SQL Server environment.

SQL Safe storage savings report

This report summarizes the storage cost savings you have gained by using SQL Safe. This savings is calculated using the following formula: (saved MB)/(1024 x cost per MB). Use this report to understand one of the many benefits of using SQL Safe.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Customize reports

You can customize any of the built-in SQL Safe reports or develop new reports that fit your unique needs. If you decide to customize these reports, consider the following best practices:

- Saving your new and modified reports to a separate folder
- Using a different file name for modified reports

For more information about developing custom reports, see the Reporting Services Books Online.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How reports work

Reports seamlessly integrates into Microsoft SQL Server Reporting Services (Reporting Services). For each built-in SQL Safe report, the Reports Installer utility deploys Report Definition Language (RDL) files to the Report Server computer. The RDL files define the report layout and parameters, using the data source (SQL Safe Repository) you specified during install. Reporting Services automatically acknowledges these files, allowing you to immediately generate and view reports on imported data using the Report Manager Web interface.

For more information about the Reporting Services architecture, see the Reporting Services Books Online.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How to run reports

With the appropriate permissions, you can generate and view data directly from the Report Manager Web interface.

To use Report Manager to run reports:

1. Start Internet Explorer, and then type `http://ReportServerName/Reports` in the Address field. For example, if you are running Reporting Services on the lab01 server computer, type `http://lab01/Reports`.
2. On the Reporting Services home page, click **SQL Safe**.
3. Click the report you want to run.

 In order to configure Microsoft SQL Server Reporting Services on your computer, you can refer to [Reporting Services Configuration Manager \(Native Mode\)](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Deploy reports

You can implement Reports on any computer running Microsoft SQL Server 2000 Reporting Services (Reporting Services) or later. The following installation scenario illustrates how you can implement Reports in an existing SQL Server environment that uses a dedicated Report Server.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Install reports

The Reports setup program installs and runs the Reports Installer utility. The Reports Installer utility allows you to specify the proxy user account credentials and select which built-in SQL Safe reports you want to deploy.

- ✔ Users with 64-bit installations must follow different steps to install reports. For more information, see Idera solution 3891: [Where do I find the SQL Safe reports?](#) in our knowledge base wiki.

The following procedure guides you through a local installation of Reports. However, you can also deploy Reports remotely.

To install reports:

1. Log on with an administrator account to the Report Server computer.
2. Run `Setup.exe` in the root of the installation kit.
3. Read the Welcome window, and then click **Next**.
4. Review and accept the license agreement by selecting **I accept the terms in the license agreement**, and then click **Next**.
5. Accept the default folder for your Reports installation, or click **Change** to specify a different folder, and then click **Next**.
6. Click **Install**.
7. On the Idera SQL Safe Reports Installer window, specify the following configuration settings, and then click **Next**.
 - Report Server Web Service URL. SQL Safe will display the default Reporting Services URL.
 - Name of the computer that hosts the Report Server
 - Name and location of the target SQL Safe Repository
 - Credentials of the Windows account the Report Server should use to connect to the repository database. The specified account should have read permissions on this database.
8. Select which SQL Safe reports you want to deploy to this Report Server, and then click **Next**.
9. Click **Install**.

- ❗ To successfully deploy reports using this utility, your logon account must have Content Manager rights on the Report Server. For more information, see the Reporting Services Books Online.

Change the report data source

You can change the Reports data source to pull data from a different Repository location. Use the Report Manager to change the data source connection link. For more information, see the Reporting Services Books Online.

SQL *Safe* is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Reports permissions and requirements

Reports leverages the existing role-based security model provided with Reporting Services. Reports supports Windows Authentication only (mixed mode on SQL Server).

Reports requires the following permissions and rights to successfully generate reports on your backup and restore data. Assign the appropriate role on the SQL Safe folder in the Report Manager. The individual report files inherit the permissions you set.

By default, the Reports Installer utility deploys the report files to Program Files\Idera\SQLsafe Reporting Services on the Report Server computer.

Account	Action	Requirements
Proxy user (specified in data source)	Connect to the SQL Safe Repository and read data per report parameters	Read access to the SQL Safe Repository database
Administrator	Configure reports and set security, run Installer utility	Content Manager role
End user (auditor or manager)	Generate and view reports	Browse role

 For more information, on how to access the Report Manager, click [Report Manager \(SSRS Native Mode\)](#) .

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Integrate SQL Safe with TSM

Use this TSM Guide to integrate SQL Safe into your existing TSM-based backup and recovery processes. SQL Safe interfaces with the TSM Client API, allowing you to backup and restore directly to the TSM Server while using the SQL Safe user interfaces. By integrating SQL Safe with your TSM deployment, you can immediately receive the benefits of fast, compressed, secure backups as well as several enterprise storage management features – without retooling your current archival workflow.

TSM integration checklist

<input checked="" type="checkbox"/>	Follow these steps ...
<input type="checkbox"/>	Install the SQL Safe components, and review the supported TSM Client versions .
<input type="checkbox"/>	Install the SQL Safe Backup Agent on each SQL Server instance on which backups will be performed.
<input type="checkbox"/>	Install the TSM Client on the same SQL Server instances, and then configure each TSM Client to connect to the TSM Server. For more information, see the IBM TSM Backup-Archive Clients Installation and User's Guide.
<input type="checkbox"/>	Ask your TSM Administrator to create a new management class for SQL Safe. For more information, see the IBM Tivoli Storage Manager for Windows Administrator's Guide.
<input type="checkbox"/>	Perform a test backup and restore using SQL Safe with TSM settings.
<input type="checkbox"/>	Create policy jobs to enforce consistent backup operations across your TSM environment.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How SQL Safe works with TSM

When you perform a TSM backup, the SQL Safe Backup Agent sends the data files directly to the TSM Server using the TMS Client API, which handles the final storage and management of the backup archives. The SQL Safe Backup Agent uses the TSM Client API options file to locate the TSM Server.

During the backup operation, SQL Safe compresses and optionally encrypts the data files before sending them to the TSM Server, minimizing the impact on your network and storage requirements. The SQL Safe user interfaces expose several TSM parameters, such as retention periods and storage locations, that can help you and the TSM Administrator more easily manage your backup archives. For more information about specific TSM functions, see the IBM TSM Backup-Archive Clients Installation and User's Guide.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How TSM data retention works

Because both SQL Safe and TSM play very important but different roles in determining data file retention, some advance planning and configuration is required before you begin using SQL Safe with TSM.

First, determine your data retention requirements. For example, you may want to groom (delete) backup archive sets after 7 days. Your TSM Administrator will need to create a new management class for SQL Safe and configure the desired data retention period in TSM (such as, retain all backup files for one week).

- ✔ When configuring TSM, note that SQL Safe accepts up to 260 characters for the TSM file path name.

Once TSM has been configured, backups can now be performed automatically using SQL Safe policies or manually using the SQL Safe CLI or XSP. When you perform a backup, you can define how long SQL Safe should retain a backup archive. Backup archives that age beyond the specified time period will not be available to restore through the SQL Safe user interfaces. However, keep in mind that these data files will be available on the TSM Server until TSM grooms the backup archives according to the retention time.

Setting data retention in SQL Safe Backup Policy jobs

When using the Management Console, you can configure the SQL Safe retention period (Remove files older than) option on the Location tab of the Policy wizard. This option specifies how long SQL Safe should keep this backup archive available for restore. The SQL Safe Backup Agent will automatically mark these data files as inactive on the TSM Server, which allows the files to be groomed (deleted) by TSM. This expiration processing is based on the retention values configured for the SQL Safe management class.

Setting data retention through the CLI

When using the SQL Safe CLI, use the `-delete backup` option to specify when SQL Safe should make a backup archive as inactive.

For example:

```
SQL Safecmd backup northwind TSM -tsmhighlevel BACKUP
-tsmmanagementclass SQL Safe -delete 1weeks
```

- ✔ You do not need to specify the Low Level filename when grooming files through SQL Safe. The Low Level filename is automatically generated in the following format: `<instance name>_<database name>_<backup type>_<timestamp>.safe`

After the designated time period, SQL Safe marks the backup archives as "deleted" in the Management Console, signaling they are no longer available to restore. However, these backup archives are simply inactive until they are permanently groomed from the TSM Server. You can manually browse inactive backup archives using the TSM Browse command and then manually restore the backup archive

Setting Data Retention through the XSP

When using the XSP, use the @delete parameter. This parameter functions in the same way as the -delete backup option in the CLI. For more information, see the sample XSP scripts available from the Programs menu.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Back up to the TSM Server

You can use the SQL Safe Backup wizard in the Management Console or the backup command in the CLI or XSP to send a backup directly to your TSM Server.

- ✔ TSM is case sensitive so special care should be taken when specifying the High Level and Low Level settings. Note that SQL Safe accepts up to 260 characters for the TSM file path name.

Backup wizard

Start the [Backup wizard](#) and follow the tabs, setting the appropriate options. On the Locations tab, select **Tape** (Tivoli Storage Manager), and then specify the following required fields:

- High Level
- Low Level
- Management class (optional)
- Client Options File (dsm.opt file)
- Connection Settings

If your backup set is located on a TSM Server other than the server included in the dsm.opt file, you can change the TSM connections settings to override the values set in the client options file. Click **Change** on this option and specify: Node Name, Node Password, Server Address and Server Port.

You can also configure SQL Safe to mark these files as inactive after a specified age.

Example CLI code snippets that use the backup command

You can also perform a backup through the CLI. Additional backup options can be set in the SQL Safe Backup wizard, from which you can generate a CLI script that includes the specified wizard settings. For example:

```
SQL SafeCmd Backup Northwind TSM -TsmClientOwnerName tsmclient
-TsmClientOwnerPassword password -TsmConfigFile "C:\Program
Files\Tivoli\TSM\baclient\dsm.opt" -TsmHighLevel Backup -TsmLowLevel
%instance%_%database%_%backuptype%_%timestamp%.safe -TsmManagementClass
mclass1 -TsmTcpServerAddress tsmserver -TsmTcpPort 1500
```

You can use the CLI to change the TSM connections settings for the client options file. The `TsmTcpServerAddress` and `TsmTcpPort` options are compatible with any command that supports TSM.

For more information about available backup options, see the usage statements in the CLI Help.

XSP

You can perform backups using the XSP. The XSP backup parameters function in the same way as backup options in the CLI. For more information, see the sample XSP scripts available from the Programs menu.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Restore a backup from a TSM Server

You can use the SQL Safe Restore wizard in the Management Console or the restore command in the CLI or XSP to restore a backup file directly from your TSM Server.

- ✔ TSM is case sensitive so special care should be taken when specifying the High Level and Low Level settings. Note that SQL Safe accepts up to 260 characters for the TSM file path name

Restore wizard

Start the [Restore wizard](#) and follow the tabs, setting the appropriate options. On the Sources tab, specify where the backup files are located. You can specify the location using either action:

- On the Repository tab, select the database you originally backed up.
- On the Tivoli Storage Manager tab, select the backup files.

Example CLI code snippets that use the restore command

You can also perform a restore through the CLI. Additional restore options can be set in the SQL Safe Restore wizard, from which you can generate a CLI script that includes the specified wizard settings.

```
SQL SafeCmd Restore Northwind TSM -InstanceName SQL2000 -TsmHighLevel
Backup -TsmLowLevel SQL
SafeDEV01_SQL2000_Northwind_Full_200805301028.safe
```

```
SQL SafeCmd Restore Northwind Tsm -InstanceName SQL2000 -TsmHighLevel
Backup -TsmLowLevel SQL
SafeDEV01_SQL2000_Northwind_Log_200805301030.safe
```

You can use the CLI to change the TSM connections settings for the client options file. The `TsmTcpServerAddress` and `TsmTcpPort` options are compatible with any command that supports TSM.

For more information about available restore options, see the usage statements in the CLI Help.

XSP

You can restore data files using the XSP. The XSP restore parameters function in the same way as restore options in the CLI. For more information, see the sample XSP scripts available from the Programs menu.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Automate backups to your TSM Server

Once the SQL Server computer has been properly configured to send and receive information from the TSM Server, you can then create policy jobs that instruct SQL Safe to write backup files directly to the TSM Server.

Start the [Backup Policy Wizard](#) and follow the tabs, setting the appropriate options. On the Locations tab, select **Tape** (Tivoli Storage Manager).

- ✔ SQL Safe will skip any invalid backup types or options. For example, SQL Safe will skip databases that are off-line, will not perform T-Log backups of databases that are in simple mode, and will ignore the object level recovery option when backing up system databases.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Browse archives on the TSM Server

The available backup archives can be viewed (browsed) by right-clicking the target SQL Server instance in the **Servers** navigation pane and selecting **Browse TSM Archives**. You can also view this information through the SQL Safe Restore wizard, CLI, or XSP. You can view a list of all available files including those flagged as inactive.

To browse the TSM Server through the Restore wizard, select **Tivoli Storage Manager** on the Source tab, and then click **Browse**.

To use the XSP browse command, see the sample XSP scripts available from the Programs menu.

Example CLI code snippets that use the browse command

To browse all active files:

```
SQLsafeCmd Browse TSM
```

To browse all active and inactive files:

```
SQLsafeCmd Browse TSM -TSMIncludeInactive
```

To browse all active and inactive files in a Highlevel called BACKUP:

```
SQLsafeCmd Browse TSM -TSMIncludeInactive -TSMHighLevel BACKUP
```

TSM is case sensitive. Be careful when specifying the High Level and Low Level file set.

SafeToSQL Utility

Use this SafeToSQL Guide to install and use the SafeToSQL utility. This utility helps you easily convert your SQL Safe archive files for use with Microsoft SQL Server. With SafeToSQL, you can use a simple command line statement to save your archive files in .bak format, ensuring they are stored in an industry-wide format.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

How SafeToSQL works

SafeToSQL provides a quick and easy way to convert SQL Safe archive files to the format used by Microsoft SQL Server. The conversion SafeToSQL performs is useful when you are sending your archive files to someone who may not have SQL Safe installed, and needs to access the archive files for troubleshooting or data migration purposes.

You can execute this conversion through a simple command-line statement from the command shell or in a batch file. When SafeToSQL converts the `.safe` file, the utility appends the name of the backup set index to the `.bak` file name.

How does the utility handle multi-threaded backup sets?

SQL Safe has the capability of creating multi-threaded backup set to multiple virtual devices. When that backup set is converted using SafeToSQL, multiple SQL Server backup files will be created, one for each virtual device.

Why does the utility output multiple backup files from a single SQL Safe archive?

SQL Safe uses multiple processing threads to apply compression and encryption settings during a backup operation. During the backup, SQL Server divides the data between separate backup devices. SQL Safe then writes the finished backup from all of these devices into a single archive file. When SafeToSQL converts the `.safe` file to native format, a separate `.bak` file is created for each device or thread that was used during the original backup. This approach ensures the information can be restored to SQL Server using the same number of devices that were used for the backup. This is a SQL Server requirement.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Deploy the SafeToSQL utility

Use the following information and instructions to successfully deploy the SafeToSQL utility in your production SQL Server environment.

Requirements

Installing and running SafeToSQL requires .NET Framework 2.0, but does not require that you install SQL Safe. Because SafeToSQL will expand your SQL Safe backups to the same size as native backups, you should ensure adequate disk space is available for the converted backups.

How to install SafeToSQL

You can install the SafeToSQL utility from the main setup program.

To install SafeToSQL:

1. Log on with an administrator account to the computer on which you want to install SafeToSQL.
2. Run `Setup.exe` in the root of the installation kit or click **SafeToSQL Utility** on the Install section of the Welcome window.
3. Read the Welcome window, and then click **Next**.
4. Review and accept the license agreement by selecting **I accept the terms in the license agreement**, and then click **Next**.
5. Choose the destination folder, and then click **Next**.
6. Click **Install**.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Create the SafeToSQL command

To use the SafeToSQL utility, run the Command Prompt, and then type the appropriate command syntax for the conversion you need to execute. Use the following descriptions to choose the options you need.

Command syntax

Use the following syntax when converting a SQL Safe archive file:

```
SafeToSQL source_file_path [-backupfile file_name] [ -backupset #]
[-password pwd] [-list]
```

Where the following option is mandatory:

source_file_path

Defined as the complete directory path and file name of the SQL Safe archive containing the backup set to convert to Microsoft SQL Server backup format.

Options

The SafeToSQL utility provides the following options.

-backupfile filename

Provides the names of additional files in multi-file archives. You must specify each file in a multi-file archive and provide the complete path to the file.

-backupset

Specifies the index (1-based) of the backup set in an archive containing multiple backup sets. ***If you do not specify the backup set index***, the backup set defaults to 1, the index of the first backup set in the archive.

-password pwd

Specifies the password for decrypting an encrypted backup set. ***If the backup set is encrypted***, provide the password you specified during backup.

-list

Prints out the complete contents of the archive specified by source_file_path.

Output file name format

SafeToSQL uses the following file naming convention for SQL Safe backup files it converts to Microsoft SQL Server backup files:

```
filename_#.bak
```

Where the file name components are as follows:

filename

Specifies the name of the source archive file.

#

Specifies the name of the backup set index.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Example SafeToSQL commands

Use the following example scenarios to create SafeToSQL commands that fit your conversion needs.

Convert an archive with a single backup set

To convert an encrypted archive that contains the *pubs* database as the single backup set, type the following command at the command prompt:

```
SafeToSQL "d:\sqlsafe_backup\LT1_pubs_01_enc.safe" -password my_password
```

The output path and name of the converted file is:

```
d:\sqlsafe_backup\LT1_pubs_01_enc_1.bak
```

Convert an archive with multiple backup sets

To convert an archive that contains the *northwind* database as the second backup set in the archive, type the following command at the command prompt:

```
SafeToSQL "d:\sqlsafe_backup\LT1_multi_01.safe" -backupset 2
```

The output path and name of the converted file is:

```
d:\sqlsafe_backup\LT1_multi_01_2.bak
```

To list the contents of the archive, type the following command at the command prompt:

```
SafeToSQL "d:\sqlsafe_backup\LT1_multi_01.safe" -list
```

Convert an archive saved across multiple files

To convert an archive saved in the directory in two files, type the following command at the command prompt:

```
SafeToSQL "d:\sqlsafe_backup\pubs_a.safe" -additionalfile "d:\sqlsafe_backup\pubs_b.safe"
```

The output path and names of the converted files are:

```
d:\sqlsafe_backup\pubs_a_1.bak
```

```
d:\sqlsafe_backup\pubs_b_1.bak
```

Availability Groups

AlwaysOn Availability Groups are part of an integrated solution, introduced in SQL Server 2012 with the goal of achieving the highest level of data availability and disaster recovery for organizations. Availability Groups grant DBAs the ability to automatically or manually failover a group of databases as a single unit with support for up to four secondary replicas. For additional information on availability groups, see the Microsoft document, [Overview of AlwaysOn Availability Groups \(SQL Server\)](#).

SQL Safe supports SQL Server Availability Groups and allows you to perform backup and recovery strategies on your primary and secondary replicas.

 Keep in mind that an agent needs to be installed on all nodes in the availability group that will be considered for backups.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Backup policies with Availability Groups

SQL Safe allows you to configure backup policies with availability groups. The policy includes all the databases in the Availability Group that you want to backup and you can determine which Availability Group members you would like to be taken into account.

Keep in mind that in Availability Groups:

- On primary replicas you can perform full, differential, and log backups
- On secondary replicas, full backups must be copy only, differential backups are not supported, and log backups must NOT be copy only

When SQL Safe performs the backup operation, it detects the preferred replica for the backup operation and it skips the non-preferred ones. Please take into account that if you add a new node as the preferred replica and it is not part of the policy, you will need to add the respective database to the policy.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Restores on Availability Groups

SQL Safe assembles all the necessary files for a restore operation even though the backups were taken from different Availability Group members. You can select which one of the Availability Group members (primary or replica) will be restored.

The **Backup Sets** section in the Restore wizard shows you backups taken from primary and secondary replicas for an Availability Group database.

Installing SQL Safe on Idera Dashboard

The **SQL Safe wizard** helps you install SQL Safe on our common technology framework: the **Idera Dashboard** on your machine.

Installing the Idera Dashboard

The **Idera Dashboard** provides a platform of services that allow an integrated user experience across multiple Idera products.

When you open the installer, follow these steps:

- Click **All Components** to install the SQL Safe desktop, web console, and Idera Dashboard.
- In the **Welcome to the SQL Safe Setup Wizard**, click **Next**.
- Select an option to run the **Idera Dashboard**. Take into account that the **Idera Dashboard** hosts the SQL Safe web console and allows you to have an integrated user experience across multiple Idera products. You can choose to install this framework locally or register with a previously installed copy on another server. For both options, you have to provide Host Name, Port, Service Account and the respective password.
- If you do not have the **Idera Dashboard** installed on your computer, the installer opens the **Idera Dashboard Setup Wizard**. Click **Next** to continue.
- Accept the terms in the License Agreement, click **Next**.
- Specify the **Destination Folder** where you want to install the **Idera Dashboard**. Click **Change** to choose a different path than the default folder. Click **Next**.
- Specify the **Service Account** under which the **Idera Dashboard** services will run. The "Log on as a service" right will be granted to this account. Click **Next**.
- Specify the ports to be used by **Idera Dashboard** Services. If the Firewall is enabled, make sure it allows TCP traffic through these ports. By default, the following ports are used:
 - Idera Dashboard Core Services Port: 9292
 - Idera Dashboard Web Application Service Port: 9290
 - Idera Dashboard Web Application Monitor Port: 9094
 - Idera Dashboard Web Application SSL Port: 9291
- Determine the name and location (SQL Server instance) of the **Repository Database** for

the **Idera Dashboard**. By default, the setup program uses the credentials of your Windows logon account to create the Repository Database. If you want to use **Microsoft SQL Server Authentication**, select this option, then specify the login name and password for this account. Click **Next**.

- The service account you specified before will be granted access to login into the **Idera Dashboard**. You can later add users. Click **Next**.
- Click **Install** to proceed with the installation process.
- After the installation, Click **Finish**.

Installing SQL Safe desktop and web console

After you install the **Idera Dashboard**, the Idera SQL Safe Installer opens, click **Next** to proceed with the installation of SQL Safe.

Go to [How to install SQL Safe](#) to follow the detailed steps for installing SQL Safe.

Review the following sections before your installation:

- [Product Components and Architecture](#)
- [Hardware Requirements](#)
- [Permission Requirements](#)
- [Software Requirements](#)
- [TSM Requirements](#)

Additionally, you can also review the [Supported Installation scenarios](#).

Registering your SQL Safe with Idera Dashboard

After you install the **Idera Dashboard** and SQL Safe on your machine, the installer prompts you to:

- Specify a name for your registration. Idera recommends that you provide a unique display name for this instance of SQL Safe on the **Idera Dashboard**. Use display names based on location or function such as "SQL SafeWest" or "SQL SafeProduction". Click **Next**.
- Click **Finish** to complete the registration and installation.

To access the **Idera Dashboard**, type the following URL in your browser: **//localhost:9290** or the port you specified.

Navigate the Welcome Wizard

The first time you access the SQL Safe Web console, a Welcome Wizard opens where you can configure the main settings of your environment. Follow these steps to navigate through this Wizard:

- On the **Welcome** tab, click **Next** to go to the next section
- On the **Users** tab, you can add new users. To specify new users, click **Manage Users** and SQL Safe opens the **Manage Users** dialog window.
- On the **Manage users** dialog window, you can use the option **Add User** to specify a new user. You can also assign it a role (Administrator, User, Read-Only). To find more information about user roles and what options you have when registering a new user, click [here](#). After adding your users, click **Next** to go to the next section.
- On the **Instances** tab, you can register those SQL Server instances you want to monitor with SQL Safe. Click **Add Instances** to register your new instances. You can click [here](#) to find more information about registering new instances. After you register your instances, click **Next** to go to the next section.
- The **Finish** tab allows you to learn about the new options available in SQL Safe. Click **Finish** to exit the Welcome Wizard.

Adding SQL Server instances

In order to perform backup and restore operations on SQL Server instances, you have to register them with SQL Safe. To register SQL Server instances, you can find the option **Add SQL Server instance** available on the following tabs:

- **Home** tab
- **Policies** tab
- **Operation History** tab
- **Instances** tab
- **Databases** tab

When you click **Add SQL Server instance**, the wizard for registering new instances opens and you can find the following sections:

INSTANCE

Use this section to specify the instance or instances you want to register with SQL Safe for monitoring. To add new instances you can use any of the following options:

- Type the name of the instance inside the SQL Server instance box. Use a semicolon to separate multiple instances.
- Use the option **BROWSE** to get a list of instances discovered by the CWF service. Select those instances you want to register.

Click **NEXT** to go to the following section.

CREDENTIALS

In this section you can specify the credentials the CWF service uses to gather data about your instances. Choose whether you want to use the CWF service account or an alternate account for each type of connection. You have two type of credentials in this section:

SQL Connection Credentials

SQL Safe uses these credentials to connect and perform queries against your new registered SQL Server instances and collect configuration, availability, performance, and capacity data.

You can specify a Windows user or a SQL Server login Account Type.

WMI Connection Credentials

SQL Safe uses these credentials to connect to the instance's host computer and gather configuration and performance data.

-  Use the option **TEST CREDENTIALS** to make sure CWF can gather data for instances and host computers.

Click **NEXT** to go the following section.

FINISH

Use this section to review all your settings. You can go to previous sections to make any needed changes. Click **FINISH** to finish registering your SQL Server instances.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

What alerts are available on the Home tab?

On this section of the SQL Safe **Home** tab, you can find a summary of your environment's alerts. SQL Safe groups these alerts by level of severity: OK (green), Informational (gray), Warning (yellow), Critical (red).

What actions can you perform on Alert Rules?

In each Alert rule, you can find the following options:

- **Show Details** - to view the complete list of instances or databases affected by the alert rule. Use the option **Hide Details** to display only the summarized form of the alert rule.
- **Dismiss** - to ignore the alert rule with their associated alerts.
- **Refresh** - to get the latest status of the alert rule.

What actions can you perform individually on each instance alert?

When you choose to **Show Details** of a specific alert rule, you can see all instances or databases associated with that specific alert rule. On each alert you can:

- **Dismiss** - to ignore the alert for that specific instance or database
- **Refresh** - to get the latest status of that specific alert

 When you **Dismiss** an alert, it will not be displayed on the **Home** tab temporarily. SQL Safe will raise the alert when the alert rule condition triggers it again.

What other actions can you perform on the Alerts section?

SQL Safe allows you to perform the following actions on the Alerts section of the **Home** tab:

- **Export** - you can export your information in any of the following formats: PDF, XLS, or XML. Additionally, you can choose from one of the following options:
 - **Summary of recommendation categories** - select this option to export all alert rules in their summarized version.
 - **Details for all recommendations** - select this option to export all alert rules information including the details of the instances or databases that are associated with them.
 - **Details for selected categories** - you can use this option to select those specific alert rule details you want to export.
- **Hide Recommendations** - use this option if you do not want to see the displayed alerts

What SQL Safe alerts can you find?

To find out more about what alerts SQL Safe notifies you about, go to [Available Alerts](#) and view the complete list of alerts, their description, severity level, and links to the respective knowledge base articles.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

What Summary information can you see on the Home tab?

On the right side of your **Home** tab, you can view a summary section with the most important information from your environment. This information is divided in the following sections:

My Environment

In this section you can view the number of:

- **Managed instances** - click this option and SQL Safe takes you to the **Instances** tab
- **Not-contacted instances** - click this option and SQL Safe takes you to the **Instances** tab where you can see the instances in your environment filtered by **Error** status.
- **Not-contacted Backup Agents** - click this option and SQL Safe takes you to the **SQL Safe Agents** tab where you can see those instances whose SQL Safe Backup Agent have an **Error** status.
- **Databases** - click this option and SQL Safe takes you to the **Databases** tab
- **Databases with failed backup** - click this option and SQL Safe takes you to the **Databases** tab filtered by **Error** status.
- **Databases with failed restore** - click this option and SQL Safe takes you to the **Databases** tab filtered by **Error** status.
- **Backup Policies** - click this option and SQL Safe takes you to the **Policies** tab where you can see policies filtered by **Backup** Policy Type
- **Restore policies** - click this option and SQL Safe takes you to the **Policies** tab where you can see policies filtered by **Restore** Policy Type
- **Log Shipping policies** - click this option and SQL Safe takes you to the **Policies** tab where you can see policies filtered by **Log Shipping** Policy Type

Status Details

In this section you can view a summary of the general status of your environment operations. The number of policies with OK and not OK status, and the number of successful and failed operations.

Disk Space Savings

In this section you can view the amount of disk space saved by SQL Safe. You can view this information for Today, this Month, this Year, the total savings, and the ROI (Return on Investment).

SQL Safe provides a built-in calculator to help you calculate your monetary return on your SQL Safe investment. The calculator attempts to measure the time and monetary savings you gain through using the SQL Safe compression scheme. The Return On Investment (ROI) calculator bases your ROI on the total cost of ownership of your storage devices multiplied by the amount of disk space savings you achieve using SQL Safe. SQL Safe defaults to the commonly used estimate of \$200 per GB of storage. You can change this estimate to reflect your particular hardware configuration by accessing the [Basic Configurations](#) of the **General Preferences** window on the **Administration** tab.

Viewing SQL Server Instances on the Home tab

On this section of the **Home** tab you can see a summary view of all your registered SQL Server instances on your environment. For each instance, SQL Safe displays the following information:

- **Status** - You can see an up status when the Instance is connected and the SQL Safe Agent is running. You get a down status when either the Instance connection failed or the SQL Safe Agent is not running.
- **Instance Name** - the name of your SQL Server instance
- **SQL Server version** - the version of your SQL Server instance
- **Status text** - In this column you can view the detailed description of your Status. For example, if it shows a down status, SQL Safe displays whether is due to an Instance connection failure, the SQL Safe Backup Agent could not be contacted, or some other error occurred.
- **# of Databases** - displays the number of databases per SQL Sever instance. Click this number and SQL Safe displays the **Databases** tab filtered by the selected instance.
- **# of Policies** - displays the number of policies that include at least one database of the respective SQL Sever instance. Click this option and SQL Safe takes you to the **Policies** tab where you can see the list of all the policies related to your SQL Server instance.
- **# of operations with failure** - displays the number of operations for this instance where the last status is a failure. Click this option and SQL Safe takes you to the **Operation History** tab where you can see all those operations with an **Error** status and filtered by your selected instance.

How can you export the information available on this section?

Click the option **Export**, select any of the following formats: PDF, XLS, and XML, and SQL Safe exports the information available about your SQL Server instances.

Available Alerts

What SQL Safe alerts can you find?

You can find the following alerts:

Alert	Description	Severity
SQL Server Instance Connection Failure	Displays those instances that cannot be contacted	Critical
SQL Safe Backup Agent Connection Failure	This alerts displays those SQL Servers in your environment where the SQL Safe Backup Agent could not be contacted.	Critical
SQL Safe Backup Agent upgrade needed	this alerts lets you view those instances where your SQL Safe Backup Agent needs to be upgraded	Informational
Databases never backed up	displays that have never been backed up by SQL Safe	
Backups failed	shows operations where the last backup for a specific database and backup type failed	Critical)
Backups did not start as scheduled	shows operations where the last backup for a specific database and backup type did not start as scheduled	Critical
Backups were skipped	shows operations where the last backup for a specific database and backup type were skipped	Informational
Backups were cancelled by user	shows operations where the last backup for a specific database and backup type were cancelled by the user	Warning
Backups completed with warnings	shows operations where the last backup for a specific database and backup type were completed with warnings	Warning

Backups Succeeded	shows operations where the last backup for a specific database and backup type were successful	OK
Restores failed	shows databases where the last restore operation for a specific database failed	Critical
Restores did not start as scheduled	shows databases where the last restore operation for a specific database did not start as scheduled	Critical
Restores were cancelled by user	shows databases where the last restore operation for a specific database were cancelled by the user	Warning
Restores completed with warnings	shows databases where the last restore operation for a specific database completed with warnings	Warning
Restores succeeded	shows databases where the last restore operation for a specific database completed succesful	OK
Log Shipping data too old	show databases where the last log shipping backup or restore for a specific database is too old	Warning

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Viewing your policies

On the **Policies** tab, you can see all the existing SQL Safe policies in your environment. For each policy, you can see the following information:

- **Status** - displays the status of the most severe operation status. In other words, in order to get a Succeeded status, all operations for each database and operation type should have completed successfully without any errors. These statuses can be:
 - **Wait** - no operations have been performed for the policy
 - **Failed** – the last policy operation for one or more databases failed
 - **Missed** – one of the last scheduled policy operations for one or more databases did not start as scheduled
 - **Skipped** - one of the last scheduled policy operations for one or more databases were skipped
 - **Cancelled** - one of the last scheduled policy operations for one or more databases were cancelled by the user
 - **Completed with warnings** - one of the last scheduled policy operations for one or more databases completed with warnings
 - **Succeeded** – all of the last operations for each database and operation type completed successfully
- **Policy Type** - displays the type of policy: Backup, Restore, or Log Shipping.
- **Policy Name** - the name with which the policy was created.
- **Databases Covered** - the number of databases covered by the policy.
- **Instances Covered** - the number of instances included in the policy.
- **Last Operation** - the date and time of the last operation executed in the policy
- **Last Operation with Failure** - the date and time of the last failed operation in the policy

How can you filter your information?

In order to get more specific policy information from you environment, you can use the Filtering section on the left side of the **Policies** tab. You can filter your information by Status, Policy Type, Policy Name, Databases Covered, Instances Covered, Last Operation, Last Operation with Failure, Instances, and Databases.

 When using filters take into account:

- If you want to select filters first and apply the changes later, unselect the option **Apply filter as it changes**.
- To remove filters, use the specific **Remove Filter** option in each filter. For example, if you want to remove your Instance filters, click **Remove STATUS Filter** under the

same filter section.

- Under **FILTERED BY** on the top section of your **Policies** tab, you can see the filters you have selected. Click the **X** icon next to the ones you want to remove.
- Use the option **Clear** on the top section of the Filtering section to remove all filters.

What other options are available from the Policies tab?

The **Policies** tab allows you to perform the following actions located on the upper section of this tab:

- **Add SQL Server instance** - click this option to register new servers. Go to [Adding SQL Server instances](#) to find more information about registering new instances.
- **Export** - click this option to export the displayed information on the **Policies** tab. You can select exporting your information in PDF, XLS, or XML file.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Viewing your Operations History

The **Operations History** tab allows you to see all operations performed by SQL Safe in your environment. For each operation, you can see the following details:

- **Status** - this column lets you view the status of each respective operation. Status can be In Progress (percentage and bar indicating the progress of the operation), Queued, Successful, Successful with warnings, Error, Canceled, Skipped, or Deleted.
- **Details** - the details about the status of the respective operation
- **Instance** - the name of the SQL Server instance where the operation was executed
- **Database** - the name of the Database where SQL Safe executed the operation
- **Operation** - the type of operation (Backup, Restore, Verify, InstantRestore, Hydrate)
- **Backup Type** - if it is a backup operation, then the type of configured backup
- **Policy** - if the operation belongs to a policy, then the name of the policy
- **Compressed, MB** - the size to which the data was compressed in MB
- **Uncompressed, MB** - the uncompressed data in MB
- **Ratio, %** - the ratio between compressed and uncompressed data in percentage
- **Database size, MB** - the size in MB of the database where the operation was performed
- **Compression** - the type of compression used for the backup operation
- **Encryption** - the type of encryption selected for the backup operation
- **Duration** - the total duration of the operation
- **Start time** - the exact time when the operation started
- **End time** - the exact time when operation finished
- **Threads** - number of threads used by the operation
- **Actions** - the gear icon under this column allows you to access options such as **Set progress to**, **Backup again**, or **Backup with different options**.

How can you filter the information on the History tab?

SQL Safe allows you to filter the information on the **Operations History** tab so that you can see quickly access your required information.

To filter your SQL Safe operations, go to the left section of the tab where you can find the following options for filtering:

- **Status** - specify the status of those operations you want to view. An operation can have any of the following status: In progress, Queued, Successful, Successful with warnings, Error, Canceled, Skipped, or Deleted.
- **Instance** - type those instances for which you want to view their SQL Safe operations
- **Database** - specify those databases for which you want to view their operations

- **Operation** - select those operation types (Backup, Restore, Verify, InstantRestore, Hydrate, or Object Level Restore) you want to view on the **Operation History** tab
- **Backup Type** - enter the backup type for which you want to view its operations. You can choose from Full, Differential, Log, or File backup operations.
- **Policy** - specify if you want to include or exclude policy operations.

✔ When using filters take into account:

- If you want to select filters first and apply the changes later, unselect the option **Apply filter as it changes**.
- To remove filters, use the specific **Remove Filter** option in each filter. For example, if you want to remove your Instance filters, click **Remove Instance** under the same filter section.
- Under **FILTERED BY** on the top section or your **Operations History** tab, you can see the filters you have selected. Click the **X** icon next to the ones you want to remove.
- Use the option **Clear** on the top section of the Filtering section to remove all filters.

What actions can you perform on operations?

Under the **Actions** column, you can find the following options when you click the gear icon:

- **Set progress to** - use this option to change the status of the operation. You can set it to Successful, Successful with warnings, Error, Canceled, Skipped, or Deleted.
- **Backup Again** - use this option if you want to repeat the backup operation. SQL Safe performs the backup with the established backup settings.
- **Backup with different options** - use this option if you want to review or change the backup settings. SQL Safe opens the [Backup Wizard](#) where you can review the settings used to perform the operation or edit according to your preferences.
- **Restore Again** - use this option if you want to repeat the restore operation. SQL Safe performs the restore with the established restore settings.
- **Restore with Different Options** - use this option if you want to review or change the restore settings. SQL Safe opens the [Restore Wizard](#) where you can review the settings used to perform the operation or edit according to your preferences.

⚠ Take into account that these options are not available for **Guest** role users.

How other options are available on the Operations History tab?

The **Operations History** tab allows you to perform the following actions located on the upper section of this view:

- **Add SQL Server Instance** - use this option to register new instances. Go to [Adding SQL Server instances](#) to find more information about registering SQL Server instances in your environment.
- **Export** - use this option to export the information displayed on your **Operations History** tab. Select your preferred format for exporting your information: PDF, XLS, or XML.

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

View your Managed Instances

The **Instances** tab allows you to view all instances managed in your environment. For each instance, you can see the following information:

- **Status** - displays the status of the respective instance. The error icon means the connection to the instance failed. The up icon represents a successful connection with the instance.
- **Instance name** - the name of the respective SQL Server instance
- **Status text** - specifies in detail the status of the SQL Server instance.
- **# of Databases** - displays the number of databases that belong to the respective instance. Click this option and SQL Safe takes you to the **Databases** tab filtered by the selected instance.
- **# of Policies** - shows the number of policies that cover at least one database that belongs to the respective instance. Click this option and SQL Safe takes you to the **Policies** view filtered by the selected instance.
- **# of Operations** - displays the number of operations in the instance. Click this option and SQL Safe takes you to the **Operation History** tab filtered by the respective instance.
- **SQL Server version** - displays the SQL Server version of the instance
- **Actions** - under this column you can find the gear icon with the following options for your instances: Remove/delete, Change Credentials, Perform Operation ([AdHoc Backup](#), [AdHoc Restore](#))

How do you filter the information on your Instances tab?

SQL Safe allows you filter your information to access your required data easily. Go to the left section of the **Instances** tab and filter according to:

- **Status** - you can select **Ok** or **Error**
- **Instance name** - type the name of the instances you want to view
- **Status text** - type an specific status
- **# of Databases** - use the options **From** and **To** to specify a range of the number of databases for which you want to see your data
- **# of Policies** - use the options **From** and **To** to specify a range of the number of policies for which you want to see your data
- **# of Operations** - use the options **From** and **To** to specify a range of the number of operations for which you want to see your data
- **SQL Server version** - type a SQL Server version for which you want to see its instances
- **Policy Name** - type the name of the policies for which you want to view their respective instances

✓ When using filters take into account:

- If you want to select filters first and apply the changes later, unselect the option **Apply filter as it changes**.
- To remove filters, use the specific **Remove Filter** option in each filter. For example, if you want to remove your Instance filters, click **Remove Instance Name Filter** under the same filter section.
- Under **FILTERED BY** on the top section of your **Managed Instances** tab, you can see the filters you have selected. Click the **X** icon next to the ones you want to remove.
- Use the option **Clear** on the top section of the Filtering section to remove all filters.

What other options are available on the Instances view?

On the upper section of your Instances list, you can find the following options:

- **Add SQL Server instance** - You can register SQL Server instances to your monitored environment. Go to [Adding SQL Server instance](#) for more information about registering new instances.
- **Backup** - use this option to open the [Backup Wizard](#).
- **Restore** - use this option to open the [Restore Wizard](#).
- **Export** - you can export the information displayed on your **Instances** view. Select your preferred format: PDF, XLS, or XML.

⚠ Take into account that these options are not available for **Guest** users.

What actions can you perform on instances?

You can select one or more instances from the **Instances** tab, click one of the respective gear icons under the **Actions** column, and perform any of the following actions:

- **Remove/delete** - use this option if you no longer want to manage the selected instances
- **Change credentials** - use this option to set different credentials to connect to the SQL Server Instance. You can go to [Add new SQL Server instances](#) to find more information about the credentials needed to monitor an instance.
- **Perform operations** - select this option to access any of the following operations:
 - **AdHoc Backup** - select this option to open the [Backup Wizard](#) with the selected instances and specify the respective settings for the backup.
 - **AdHoc Restore** - take into account that this option is only available when you select a single instance. SQL Safe opens the [Restore wizard](#) so that you can specify the respective settings for the restore operation.

⚠ Take into account that these options are not available for **Guest** users.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
----------------------	-----------------	-----------------	----------------	------------------	-----------------	------------------	--------------

Databases view

SQL Safe allows you to view a list of all the databases that belong to your SQL Server instances. In this tab you can view the following information for each database:

- **Status** - it displays the status of the database, it can be OK, Error, or Warning.
- **Instance Name** - the name of the instance where the database resides
- **Database Name** - the name of the respective database
- **Database Type** - if it is a User or System database
- **Last Full Backup** - the date and time when the last full database backup was executed
- **Last Diff Backup** - the date and time when the last differential database backup was executed
- **Last Log Backup** - the date and time when the last log database backup was executed
- **# of policies** - the number of policies that cover the database
- **Space used** - the amount of space used by the database
- **Actions** - under this column you can find a gear icon with the following options: **AdHoc Backup** and **AdHoc Restore**.

What information can you filter in the Databases view?

SQL Safe allows you to filter the information available on the **Databases** tab to quickly access your required data. To filter your information, go to the left section of the tab and filter your information according to:

- **Status** - select a database status. You can choose from Ok, Warning, or Error.
- **Instance Name** - type the names of the instances for which you want to see their databases.
- **Database Name** - type the names of the databases you want to view.
- **Database Type** - select if you want to view **User** databases or **System** databases
- **Last Full Backup** - use the options **From** and **To** to set specific a date range of last Full backups for which you want to view your databases
- **Last Diff Backup** - use the options **From** and **To** to set specific a date range of last Diff backups for which you want to view your databases
- **Last Log Backup** - use the options **From** and **To** to set specific a date range of last Log backups for which you want to view your databases
- **# of policies** - use the options **From** and **To** so set a range of the number of policies for which you want to view your databases
- **Space used, MB** - use the options **From** and **To** to view the databases that belong to a specific space range in MB
- **Policy Name** - type the name of the policies for which you want to view their databases

✓ When using filters take into account:

- If you want to select filters first and apply the changes later, unselect the option **Apply filter as it changes**.
- To remove filters, use the specific **Remove Filter** option in each filter. For example, if you want to remove your Instance filters, click **Remove STATUS Filter** under the same filter section.
- Under **FILTERED BY** on the top section or your **Databases** tab, you can see the filters you have selected. Click the **X** icon next to the ones you want to remove.

- Use the option **Clear** on the top section of the Filtering section to remove all filters.

What actions can you perform on Databases?

On the **Databases** tab, you can select one or several databases, and click one of the following options from the gear icon under the **Actions** column. You can also use the options from the upper section of this tab.

- **Adhoc Backup** - select this option to open the [Backup Wizard](#)
- **Adhoc Restore** - select this option to open the [Restore Wizard](#)

 The **Backup** and **Restore** options are not available to **Guest** users.

What other options are available on the Databases tab?

You can also find the following options in the upper section of the Databases list:

- **Add SQL Server Instance** - use this option to register new instances and launch the [Add Instance Wizard](#).
- **Export** - use this option to export the information displayed on the **Databases** tab, select your preferred format: PDF, XLS, or XML.

 The **Add SQL Server Instance** option is not available to **Guest** users.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Managing SQL Safe Agents

The **SQL Safe Agents** tab allows you view all servers that host instances in your environment.

For each server you can see the following information:

- **Status** - it displays the status of the SQL Safe Backup Agent which could be:
 - **Error** - SQL Safe cannot connect to the Backup Agent on the server
 - **Warning** - SQL Safe connected to the SQL Safe Backup Agent but the Backup Agent is not the most current version or is not configured for the same management service.
 - **Ok** - the SQL Safe Backup Agent is available and configured correctly
- **Computer name** - the name of the computer where the SQL Safe Backup Agent is running
- **Version** - the version of the SQL Safe Backup Agent
- **Management Server** - the name of the management server that the SQL Safe Backup Agent is configured for
- **Max Load** – the maximum number of concurrent operations that can be executed by the SQL Safe Backup Agent
- **Priority** - displays the Windows thread priority at which the Backup Agent threads run
- **Send Status** - displays the frequency with which the agent is configured to communicate with the Management Server
- **SQL Timeout** - displays the SQL DMO timeout value, which determines how long the Backup Agent will wait for a response from SQL Server before timing out.
- **VDI Trans. Limit, bytes** - displays the maximum size of a transfer block for the VDI operation
- **VDI Buffers, bytes** - displays the number of buffers used for the VDI operation
- **VDI Block Size, bytes** - displays the size of a VDI device block. All data transfers are integer multiples of this value.
- **VDI Timeout, seconds** - displays the timeout for configuring the VDI.

How can you filter your information?

You can filter the information of the SQL Safe Agents tab to access your data quickly.

Filter your information by Backup Agent status, Computer name, Backup Agent version, Management Server the Backup Agent if configured for, Max Load range, Priority range, Send Status, VDI Trans.Limit byte range, VDI Buffers byte range, VDI Block Size byte range, and VDI Timeout range.

✔ When using filters take into account:

- If you want to select filters first and apply the changes later, unselect the option **Apply filter as it changes**.
- To remove filters, use the specific **Remove Filter** option in each filter. For example, if you want to remove your Instance filters, click **Remove Status Filter** under the same filter section.
- Under **FILTERED BY** on the top section of your **SQL Safe Agents** tab, you can see the filters you have selected. Click the **X** icon next to the ones you want to remove.
- Use the option **Clear** on the top section of the Filtering section to remove all filters.

What other options are available on the SQL Safe Agents tab?

You can also find the following options in the upper section of the SQL Safe Agents tab:

- **Refresh** - use this option to get the latest status of your SQL Safe Agents.
- **Export** - use this option to export the information displayed on the SQL Safe Agents tab.
You can select your preferred format: PDF, XLS, or XLM.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Using the Backup Wizard

SQL Safe helps you see the status of your environment; when databases were last backed up or when backup operations finished with warnings. Almost all tabs provide information about your recent backup operations and backup policies.

SQL Safe web console allows you to access the Backup Wizard from the following sections:

- **Home** tab
- **Instances** tab
- **Databases** tab

The Backup Wizard contains the following sections:

- [Databases](#)
- [General](#)
- [Locations](#)
- [Options](#)
- [Notifications](#)
- [Finish](#)

Go to each section to review the respective steps and details.

 Take into account that the Backup option is not available for **Guest** role users.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting databases for backup

The **Databases** section of the Backup wizard allows you to specify the SQL Server instance that hosts the databases and the specific databases you want to back up.

What can you do on the Databases tab?

You can select the SQL Server instance that hosts your target databases. Use the drop down arrow to access those instances in your environment.

After selecting your instance, the database list is populated. From the database list, select the databases you want to backup. You can select from the list of **System Databases** or **User Databases**. SQL Safe allows you to see when the Last Backup was performed on each database and how much space was used.

If you want to ...	Select this option ...
Back up all databases on the selected SQL Server instance	All Databases
Back up only User databases on the selected SQL Server instance	All User Databases
Back up only System databases on the selected SQL Server instance	All System Databases (master, model, msdb, distribution)
Back up only the databases you specify on the selected SQL Server instance	Specific Databases, and then choose the appropriate databases

Why is the target instance not listed?

The instance list only includes SQL Server instances that have been registered with SQL Safe. If the instance is not in the drop-down list, make sure the instance is registered by using the [Add Instance Wizard](#).

After selecting your databases for backup, go to [Choosing the backup type](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Choosing the backup type

The **General** section of the Backup wizard allows you to specify the backup type, name, and description of the backup you are creating.

What types of backups can you choose?

SQL Safe supports the standard SQL Server database backup types:

- Full
- Differential
- Transaction Log
- File

What should you do for your initial backup?

If you are backing up the database for the first time, select **Full**. A full backup will provide a comprehensive data set and SQL Safe requires it to perform differential backups or transaction log backups later on. For more information about backup types, go to [Understand backup types](#).

When should you specify a description?

After you specify the name for your backup operation, you should provide a description to identify important details about this operation so you can easily recognize which backup sets should be restored later. The backup description will appear in the status view of past and current backups and will allow you to identify problems when they occur.

What is a copy-only backup?

A copy-only backup is a copy of the database, not a true backup, and cannot be used as a part of a restore strategy or restore chain. It is a backup that does not affect the log sequence numbers (LSN) of the database.

How do you verify the integrity of your backup?

You can choose the option to **Verify Backup**. When this option is selected, SQL Safe performs a data integrity check after the backup has been created. SQL Safe only verifies the integrity of the data files in the backup set created by this backup.

Verifying the backup helps identify potential issues that could occur when restoring data files.

After choosing your backup type, go to [Selecting the location of your backup files](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting the location of your backup files

The **Locations** section of the Backup wizard allows you to specify the backup location you want to use to store the backup set.

For a TSM backup, you can change the TSM connections settings to override the values set in the client options file if you need to write the backup files to a TSM Server other than the TSM Server already specified in the dsm.opt file.

Where can you store your backup set?

SQL Safe supports the following location types:

- Single File
- Striped Files
- Tape (Tivoli Storage Manager)
- Data Domain

What do you do if you do have an existing archive?

If the **Archive Exist**, you can select to **Append** it to an existing archived backup set or choose to **Overwrite** it.

What happens if you do not have an existing archive file?

If you do not have an existing archive file, SQL Safe creates a new archive file to include the backup set.

What actions do you have for each location type?

Location Type	Actions
Single File	Choose if you want to Overwrite or Append the existing archive file, the name for the Primary Archive file, and the Mirror Archives Filenames.
Striped Files	<p>Choose if you want to Overwrite or Append the existing archive files.</p> <p>Specify as many filenames as the number of striped files you want.</p> <p>When backing up SQL Server 2000 databases, consider using as few striped files as possible since a high number of striped files can significantly degrade performance due to SQL Server memory allocation.</p>

Tape (Tivoli Storage Manager)	<p>Choose if you want to Overwrite or Append the existing archive file.</p> <p>Enter the path to the TSM configuration file (High Level, Low Level, and Management Class)</p> <p>Specify the TSM Client Settings (Client File and Connection Settings). For these settings, you have to specify the name of the node you want to use, the password required to access the node, and the TCP/IP Server address and port.</p>
Data Domain	<p>Choose if you want to Overwrite or Append the existing archive file, the name of the Primary Archive filename, and the Mirror Archives Filenames.</p>

What are striped files?

If you want to take advantage of distributing I/O overhead for a large database, you can select striped files and choose backup locations on different local disks.

When backing up SQL Server 2000 databases, consider using as few striped files as possible since a high number of striped files can significantly degrade performance due to SQL Server memory allocation.

How do you handle errors encountered while writing to the network during a backup?

Select **Enable Network Resiliency** and access the **Network Resiliency Settings** window where you can specify how often you want to retry when errors occur and after how much time the operation will fail. You can also configure how much time is allowed for the total retry time of the backup.

How do you mirror your backups?

Mirroring your backups is available when you select Single File or Data Domain location type. Select **Mirror Archives**, then specify where you want the mirror copies to be stored.

For each mirror, SQL Safe creates a copy of the backup archive set. You can specify up to two mirror archives for each backup operation. Keep in mind that creating mirrors can impact the performance of your backup operation.

If you want to stop the backup operation when the mirror location is unavailable, select **Abort backup if a mirror location reports a failure**.

After selecting the location of your backup files, go to the [Configuring options for backup](#) section.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
--------------------------	-----------------	-----------------	----------------	------------------	---------------------	------------------	--------------

Configuring options for manual backup

The **Options** section of the Backup wizard allows you to select additional options, such as compression and encryption to use for the current backup operation.

What types of compression algorithms are available?

- None
- IntelliCompress, optimize for size (iSize)
- IntelliCompress, optimize for speed (iSpeed)
- Levels 1, 2, 3, 4

✔ A backup operation using Level 1 completes fastest but achieves the least amount of compression. Level 4 achieves maximum compression, but the backup operation may take longer.

For more information about backup compression, see [How to choose compression and encryption](#).

What types of encryption algorithms are available?

- None
- AES (128-bit)
- AES (256-bit)

If your SQL Server environment requires FIPS compliance, use the AES encryption option. For more information, see [Ensure FIPS compliance](#).

Does encryption require a password?

When you choose to encrypt an archive, you must assign a password. For security reasons, SQL Safe does not store this password. Ensure you remember the password you select.

What are the advanced options?

The following options are available as Advanced Options:

Options	Description
Number of threads	Allows you to specify how many threads you want SQL Safe to use to distribute the backup operation for compression across multiple processors on the target SQL Server computer. Use this setting to optimize backup performance. Select Auto to have SQL Safe determine the optimal thread count for your environment.
Remove inactive transaction log entries	Removes all completed transactions from the transaction log after SQL Safe finishes the backup. This option is only available for Log backups.

Generate maps (for InstantRestore and SQL virtual database)	Generates maps containing metadata for each database included in your backup file. Depending on the number of transactions completed since your last backup, generating maps may impact the performance of the backup operation. Generating maps is optional but must exist in the backup file for InstantRestore to accept and restore that file. SQL virtual database can attach SQL Safe backup files without the metadata, but the data files improve SQL vdb performance during creation of the virtual database. For more information, see Recover objects using SQL virtual database . This option is selected by default.
Include database logins in backup file	Copies SQL login information for the selected databases, including credentials and privileges, when the backup files are written. To help ensure the security of your SQL Server database, SQL Safe encrypts the login information. This option is available for full backups only.

What are the advanced options for SQL Server 2005 and later?

The following options are available as Advanced Options for SQL Server 2005 and later:

Options	Description
Generate checksums	Generates a checksum for the backup file.
Ignore checksum errors	Select this option to ignore any errors from the generated checksum. If checksum errors are encountered, this option indicates that SQL Safe should continue to back up this database.
Read-write filegroups	Specifies a partial backup, which includes the primary filegroup and any read-write secondary filegroups. Read-write filegroups are not supported by SQL virtual database. If this option is selected, the Generate metadata option will be disabled. Additionally, backups created with the read-write filegroups option cannot be used by SQL virtual database to create virtual databases.

After configuring the options for your backup, go to [Configuring Notifications](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configuring notifications for manual backup

The **Notifications** section of the Backup wizard allows you to email status notifications to the appropriate database administrators about this backup. Email notifications let you, and your staff, remotely monitor the status of your backups.

You can choose any of the following status to monitor:

- Backup fails
- Backup is skipped
- Backup is cancelled by user
- Backup completes with warnings
- Backup succeeds

Type the email address of each recipient. Use semicolons to separate multiple email addresses.

 You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings for status notifications](#).

When is the email sent?

SQL Safe sends an email to the specified recipients only when the selected backup status occurs. For example, if you chose to monitor whether the backup fails, you will not be emailed if the backup is skipped. Because you are performing a manual backup, you will receive one status notification.

After configuring notifications for your backup, go to the final section to [Review Details](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Generating scripts for backup and restore operations

You can generate CLI and T-SQL scripts for backup and restore operations through the Backup and Restore wizards. SQL Safe generates the CLI or T-SQL script using the settings you specified for the backup or restore operation.

CLI scripts can be run as a batch file from the command line prompt. Generated CLI scripts use supported options for the backup and restore actions.

T-SQL scripts can be run through Query Analyzer or as a scheduled SQL Server job. Generated T-SQL scripts leverage the SQL Safe XSP to execute backups and restores.

If you need a command line or T-SQL script for your backup or restore, SQL Safe provides the **Generate Script** button to let you generate CLI and T-SQL scripts for these operations. When you use a wizard to run a backup or restore, SQL Safe disables this button until sufficient criteria exists to generate a script. SQL Safe generates the CLI or T-SQL script using the settings you specified for the backup or restore operation.

How do I generate script?

You can generate script through the Backup Wizard or the Restore Wizard once your settings provide SQL Safe with enough information to create the script. Click **Generate Script**, and SQL Safe displays command line script by default. Click the T-SQL button and SQL Safe displays the script in T-SQL format.

To retain your script in either format, click the **Save to a file** or **Copy script to clipboard** icon. SQL Safe also allows you to use normal select, cut, copy, and paste functionality directly on the displayed script.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Reviewing details for manual backup

When you reach the **Finish** section of the Backup Wizard, you can go to previous sections and make any necessary changes.

You can also click **Generate Script** to have SQL Safe generate T-SQL and Command Lines of your backup operation settings.

After you have reviewed the information, click **Finish** to submit the backup job immediately.

How do you verify the status of your backup?

If you chose to run the backup job immediately, and want to verify a successful run, you can view its status in the **Operation History** tab.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Using the Restore Wizard

SQL Safe web console allows you to access the **Restore Wizard** from the following sections:

- **Home** tab
- **Instances** tab
- **Databases** tab

When you click the **Restore** option from any of the previous locations, SQL Safe prompts you to choose a restore operation for **Database(s)** or **Object Level Recovery**.

If you want to perform a restore operation for **Database(s)**, the **Restore Wizard** will open with the following sections:

- [Target](#)
- [Databases](#)
- [Backup Sets](#)
- [Database Files](#)
- [Recovery State](#)
- [Restore Type](#)
- [Notifications](#)
- [Finish](#)

If you want to perform a restore operation for **Object Level Recovery**, click [here](#).

 Take into account that the Restore option is not available for **Guest** role users.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting the target instance for restore

The **Target** section of the Restore wizard allows you to select the instance to where you will restore the database.

On this section, you can follow these steps:

- Select from the drop-down list the SQL Server instance where you want to restore your databases. If your instance is not listed, then register it by using the [Add Instance Wizard](#).
- Choose which action you want to perform:
 - **Restore** - use this option to restore your databases. You can instruct SQL Safe to disconnect users from the databases before performing the restore by selecting the option **Disconnect users before the restore**.
 - **Verify** - select this option when you want to ensure your backup operations are successful without actually restoring your data. Consider using this restore verification option on all critical backups after executing the backup operation.
- You can specify the number of threads for decompressing data or you can choose the **Auto** option so that SQL Safe calculates the optimum number of threads for your operation.

Click **NEXT** to go to the [Databases](#) section.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting the databases you want to restore

The **Databases** section of the Restore wizard allows you to specify the databases you want to restore and the general location of the corresponding archive files. You can select backups from the following locations:

- **Repository** - use this option when the backup files reside in your repository. Choose the SQL Server where the database(s) to be restored were backed up, then select the databases you want to restore.
- **File System** - use this option when the archive file was written to the local File System. Type the path from the network share or local drive and click **ADD**. This path must be accessible by the Backup Agent installed on the Agent Computer.
- **Target Server** - use this option when a network share is available on a remote file system (Target Server). Type the respective path and click **ADD**.
- **Tivoli Storage Manager** - use this option when the backup was performed using TSM. Specify the TSM Client Option File, Node name and password, Server address and port, and Path. When restoring from a TSM Server, browse for the correct database archive. You can change the TSM connections settings to override the values set in the client options file.

Click **NEXT** to go to the [BACKUP SETS](#) section.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting the backup set for the restore

The **Backup Sets** section of the Restore wizard allows you to choose which backup sets you want to use to restore the selected databases.

How do you select Backup Sets?

For each database you have selected to restore, the backup set listing is populated with the available backup sets from the Repository. To restore more than one database, select a backup set for each database.

Select the specific backup set to restore by clicking the respective backup files from the list of Backup Set Names. Use the time slider to find your backup sets at specific points in time.

You can also select a point in time to locate your backup sets.

What are the encryption settings?

Use the option **Encryption Settings** for backup sets that were encrypted during its backup. Use this option to specify the encryption password.

How do you keep your restores running despite network errors?

Click **Configure Resiliency** to configure your **Network Resiliency Settings** and keep the restore operations running despite network errors. By default, SQL Safe will retry the restore operation every 10 seconds and then fail after 5 minutes (300 seconds) of continuous errors. Also, over the course of the operation, SQL Safe allows a total of 60 minutes in which to retry the restore before stopping the operation. You can configure these settings according to your requirements.

Click **NEXT** to go to the [Database Files section](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more > >](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Specifying database files

The **Database Files** section of the Restore Wizard allows you to change the names of the restored databases or edit the data file locations of the restored files.

What settings can you specify on the Database Files section?

For each database you have selected to restore, you can edit the following fields:

- **Restore As** - type a new name for the database you will restore.
- Select restore options:
 - **Force Restore (replace)** - choose this option to ensure the selected backup files are restored, even if that means overwriting an existing database.
 - **Restore Database logins** - choose this option to restore the SQL logins associated with the selected databases. This option is available when you are restoring a full backup that contains the database login information.
 - **Ignore Checksum Errors** - choose this option to ignore any errors from the generated checksum. If checksum errors are encountered, SQL Safe should continue to restore the backup file.
 - **Preserve replication settings** - choose this option to retain the settings used when the selected databases were replicated.
- **Change Path** - type a new path for the target database
- Edit the filename of the restoring file - Edit the names you want to change in the **Restore as Filename** field. When you select a database name from the drop-down list or edit the field, the **Restore As Filename** is automatically updated to reflect the new name, but you can edit this field by directly typing in it.

✔ To restore a database over an existing database, select the **Force Restore** option to ensure SQL Safe writes the selected backup files over the existing database.

Click **NEXT** to go to the [Recovery State section](#).

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting recovery state

The **Recovery State** section of the Restore Wizard allows you to choose the recovery state that each database should be left in after the restore operation.

Which recovery states are supported?

SQL Safe supports the following recovery states:

- **Fully Accessible** - Leaves the database operational. No additional transaction logs can be restored.
- **Not Accessible (no recovery mode)** - Leaves the database non-operational but able to restore additional transaction logs.
- **Accessible but read-only (standby mode)** - Leaves the database in read-only state and able to restore additional transaction logs. You can specify an **Undo file** for this option.

 Take into account that **Fully accessible** is the only recovery state supported by the **InstantRestore** feature. If you choose a partial recovery state, you cannot restore your database using InstantRestore. For additional information about performing an InstantRestore, see [How InstantRestore works](#).

Click **NEXT** to go to the [Restore Type](#) section.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Selecting restore type

The **Restore Type** section of the Restore Wizard allows you to choose whether you want to use the [InstantRestore](#) option when restoring your database.

 Take into account when **InstantRestore** can or cannot be used:

- **InstantRestore** is not available for all restores as not all properties are supported; for example, you cannot restore a SQL Safe backup from a TSM Server.
- **InstantRestore** supports only complete database restores and does not support file or filegroup restores.
- **InstantRestore** can only work when you choose a Fully Accessible recovery state.

What is the benefit of using InstantRestore?

In most cases, **InstantRestore** allows you to use the database almost immediately after starting the restore. If you have large databases that you need to access very quickly, this may be the best option for you, but take into account that there may be some performance issues if your users are making changes to the database while the restore is in progress.

InstantRestore will bring the database online quickly allowing you to access your data while SQL Safe continues to restore the database in the background.

What options do you have available in this section?

You can choose between:

- **Normal SQL Safe Restore** - SQL Safe will restore the database using the traditional restore engine and the database will become available when the restore completes.
- **SQL Safe InstantRestore** - the database will become available in a fraction of the time that a normal restore normally takes.

 If you have not enabled the **InstantRestore** feature yet, click **Enable InstantRestore**.

Click **NEXT** to go to the [Notifications](#) section.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Configuring notifications for manual restore

The **Notifications** section of the Restore Wizard allows you to email a status notification to the appropriate database administrators about the restore operation. Email notifications let you and your staff remotely monitor the status of your restores.

Choose any of the following status you want to monitor:

- Restore fails
- Restore is cancelled by user
- Restore completes with warnings
- Restore succeeds

Type the email address of each recipient, separating them with semicolons.

✔ You must configure your mail server settings before SQL Safe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [Configure e-mail settings for status notifications](#).

When is the email sent?

SQL Safe sends an email to the specified recipients only when the selected restore status occurs.

Click **NEXT** to go to the [Finish](#) section.

Reviewing details for manual restore

You are ready to start the restore operation, but if you want to change any of the restore settings, you can go to the previous sections and change the respective configurations.

You can click **Generate Script** to generate the respective Command Line and T-SQL scripts with all restore configurations.

What do you do next?

After you have reviewed the information on the **Finish** section, click **Finish** to submit the restore job immediately. You can view its status in the [Operation History](#) tab.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Restoring Object Level Recovery

You can select to perform an **Object Level Recovery**. When you choose this option, the **Restore Wizard** opens with the following options:

- **Target** - In this section you can select the SQL Server instance where you want to restore. Go to [Selecting the target instance for restore](#) for more detailed information.
- **Databases** - specify the databases you want to restore and the general location of the corresponding archive files. Go to [Selecting the Databases for restore](#) for more detailed information. Take into account that Tivoli Store Manager location is not available for Object Level Recovery.
- **Backup Sets** - choose which backup sets you want to use for restore. Go to [Selecting the Backup set for restore](#) for more detailed information.
- **Temporary Location** - select where to restore virtual databases. Type the path in **Temporary Location** and select your instance from the drop-down options.
- **Database Objects** - for each **Database Virtual Object**, specify in **Restore As** the name with which you want to restore your database virtual object and type your **File location**. You can also select the database objects to restore separately, such as tables, stored procedures, functions, views, schemas, etc.
- **Finish** - Before clicking **Finish** to proceed with your restore operation, you can go to previous sections to review and make any necessary modifications.

 For more information about recovering objects using SQL Virtual Database, click [here](#).

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Manage users

In this section you can manage your users, groups, add new ones, remove them, give them role permissions, and other options.

SQL Safe allows you to have three roles of users with the following permissions:

- **Administrator** - can view all tabs and dialogs in the SQL Safe Web console and perform all available operations
- **User** - can access all SQL Safe views except the **Administration** tab. They can perform all operations on the tabs they can access.
- **Guest** - can view all SQL Safe tabs except the **Administration** tab. They cannot perform operations and can only access read-only dialog windows.

The Manage Users section of the **Administration** tab is only accessible to Administrators. On this view you can perform the following actions:

- **Add new users or groups** - click the option **Add User/Group** on the top section of the **Manage Users** dialog window.
- **Edit existing users or groups settings** - select the pencil icon  next to the respective user to edit its settings.
- **Remove users or groups** - click the **X** icon next to the selected user to delete it.

What settings can you define for each user or group?

When you add a new user or group, you can define the following settings:

- **Account name** - specify the name of the new user or group you want to add. Use the following format: domain\accountname
- **Account Details** - specify the amount of time in minutes the browser will wait before the session times out.
- **Email Address** - type the email address where you want the new user or group to receive the welcome email and other notifications. Take into account that you must configure your [SMTP Server settings](#) first in order to send emails. You can select **Send Welcome email** to receive a welcoming email notifying of the new account and permissions.
- **Product** - use the drop down option to select which Idera product the user will be able to access.
- **Role** - define which role (Administrator, User, or Guest) the new user or group should have.

SMTP settings for notifications

You can enable SQL Safe to send email notifications about the current status of your backup and restore operations.

Access these settings by clicking **Configure Notifications Settings** on the **Administration** tab. This option is only available to Administrators.

What email settings can I change?

If you enable **E-mail Notifications**, you can configure how the email will appear in your Inbox.

Sender Name

Enter the name that will appear as the sender of the email.

Reply to Address

Enter the email address that will appear as the sender and where replies to the message will be sent.

Priority

Select low, normal, or high priority for the email alerts.

What mail server information is required?

You must specify the mail server information so that SQL Safe can send email notifications.

Use Gmail as an SMTP Server

Select this option if you want to use Gmail as your preferred SMTP email server. SQL Safe automatically populates the respective SMTP Server Address (smtp.gmail.com) and Port (587). When you select this option, you need to provide the respective username and password.

 Take into account that if you choose to use Gmail as your SMTP email server, you could require to turn on **need to activate less security apps access**. In other words, click the respective link and select **Turn on** access. For more information, go to [Allowing less secure apps to access your account](#).

SMTP Server Address

If you do not want to use Gmail as your email server, you can also specify the SMTP address of your respective email server.

SMTP Server Port

Specify the port for your email server. You can also enable SSL encrypted connection.

SMTP Authentication

If your SMTP server requires authentication, you must type a valid **User Name** and **Password** that SQL Safe can use to access the email server.

Test your settings

To be sure that your settings are correct, click **Send Test Email** on the bottom section of the

window, then check the test email sent to your email server.

Basic Configurations

In this section, you can set the following options:

- **Automatically refresh status** - check this option to have the status automatically refreshed on the screen. If you select this option, you can also define the **Number of seconds between each refresh**.
- **Return on Investment (ROI)** - In this option you can define the TCO/GB (total cost of ownership per gigabyte) that SQL Safe will use to calculate the ROI. By default this value is set to 200\$/GB.
- **Troubleshooting** - you can define the following options:
 - **Enable Debug Logging** - where you can click **Advanced** to get additional logging options.
 - **Do not use ICMP Ping when contacting hosts**

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Repository and Management Service Settings

In this section, you can define the following settings:

- **Location of Management Service** - specify the name of the computer that hosts the management service. Click **Change** to define a different computer than the one previously specified.
- **Repository database for Management Service** - use this option to configure the settings of your repository database such as:
 - **SQL Server** – type the SQL server hosting the repository database.
 - **Database** – type the repository database name
 - **Authentication** - you can select to use a **Windows** or **SQL Server** account to connect to the repository database. If you select **SQL Server** account, you need to provide the respective username and password. Additionally, you can use the option **Test connection** to verify the provided account can successfully connect to the repository database.
- **Repository grooming** - use this option to specify the number of days SQL Safe will keep operational history before grooming it.

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >

Idera Website	Products	Purchase	Support	Community	About Us	Resources	Legal
-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Backup Preferences

In this tab you can set the following preferences:

Where to access backup archives on file system

Use this section to configure:

- **File System location** - define the path where backup archives are located. By default, C:\Backup\ is used as the File System location. You can type a different path.
- **Retry writing backup files after network errors** - select this option if you want to retry writing backup files after network errors. Click **Configure** to specify retry settings such as the interval between each retry or how long SQL Safe will wait until it fails the operation.

Where to access backup archives on Tivoli Storage Manager

In this section you can configure the High level, Low Level, and the path where to find the Configuration File for TSM. To change any of these settings, type directly into the box field.

How to store backup archives

In this section you can configure or select the following options:

- **If archive exists** – use this option to define what to do if the archive already exists. You can **Append** to an existing archived backup set or choose to **Overwrite** it.
- **Compression** - use this option to specify your compression level (**iSpeed**, **iSize**, **Level1**, **Level2**, **Level3** or **Level4**). Go to [Understand compression levels](#) to know what each level of compression entices.
- **Encryption** - select what type of encryption you want to use. Go to [Understand encryption levels](#) to know what each level of encryption means.
- **Generate metadata for quick access by SQL Virtual Database**
- **Include database logins in backup file**

What format to use to generate default file names

SQL Safe allows you to define what format you want to use for generating backup file names. You have two box fields in this section:

- **Use the following template** - In this box field, click the place where you want to add syntax for your backup file name, then click **Insert**. You can select from Backup Type, Database Name, Instance Name, Stripe Ordinal, Stripe Total, Timestamp, or UTC Timestamp and the format will be inserted in the location selected. Use the option **Reset** to get back to a previous configuration.
- **Preview** - SQL Safe displays the format settings specified in the previous field.

Tune Performance

In this section you can specify the number of threads SQL Safe will use when performing a single archive backup. You can set it to Auto, 1, 2, 28, etc.

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Manage License Keys

You can manage your License Keys settings by going to the **Administrator** tab and clicking **Manage Licenses**. This option is only available to Administrators.

The **License Key Manager** provides an intuitive, simple-to-use interface for SQL Safe license key management. On this window, you can view your license keys and the instances associated to them.

For each License Key, you can view the following information:

- License Type
- Expiration Date
- Instance associated

Additionally, you can perform the following actions on the **License Key Manager**:

- **Add** - click this option to enter a new license key. Enter a license for each licensed SQL Safe Backup Agent. Type one license per line.
- **Remove** - use this option to delete licenses.
- **Save to file** - use this option to save the **License Key Manager** information to a file.

Viewing SQL Safe on the Idera dashboard

The **Idera Dashboard** allows you to view the status of your Idera products.

If you have added SQL Safe to your **Idera Dashboard** (for more information see the [Installing SQL Safe on your Idera Dashboard](#)), then you can view the following widgets in the **Details** and **Overview** tabs:

- **Longest Running Backup Jobs** - displays the top longest running backups by database in your environment in minutes.
- **Top Databases Backups by size** - displays the top largest databases in your environment in MB and to which instances they belong to.
- **Top Databases by Alerts** - displays the number of alerts per database in your environment and their respective instances.
- **Safe Status Details** - displays a summary of your SQL Safe policies and operations in your environment.
- **Safe Disk Space Savings** - displays the total of savings achieved by using SQL Safe and the respective ROI (Return on Investment). You can set this value in the [Basic Configurations](#) of the **General Preferences** window of your **SQL Safe Administration** tab.

✔ Customize your **Details** and **Overview** tabs by dragging and dropping widgets, expanding , collapsing , closing  or limiting the amount of information displayed .

✔ To view more information how to customize your **Idera Dashboard Views**, click [here](#).

Navigate the Idera Dashboard

What is the Idera Dashboard?

The **Idera Dashboard** is a common technology framework designed to support the entire Idera product suite. The **Idera Dashboard** allows users to get an overview of the status of their SQL Servers and hosted databases in a consolidated view, while providing users the means to drill into individual product dashboards for details.

The **Idera Dashboard** is comprised of the following tabs:

- Overview
- Details view
- Administration

What actions can be performed in the Overview tab of the Idera Dashboard?

In the **Idera Dashboard** users can glance at their registered products overall status through the **Overview** tab. This tab contains product widgets of all the products registered with the Idera Dashboard. By default the **Overview** tab contains the following widgets:

- Overall status
- Instance status
- Instance list
- Active alerts list

You can expand or collapse a widget by clicking . You can also view a widget in full size by clicking  or remove it by clicking .

Customize the Overview tab

Users can customize this view in the **Configure Navigation Order** section of the **Administration** view.

What actions can be performed in the Details view of the Idera Dashboard?

In the **Idera Dashboard** users can select specific metrics to display in the **Details** view tab. This tab contains product widgets of all the products registered with the **Idera Dashboard**. To view more about what widgets are available for SQL Safe, go to [Viewing SQL Safe on the Idera Dashboard](#).

You can expand or collapse a widget by clicking . You can also view a widget in full size by clicking  or remove it by clicking .

Customize the Details view tab

Users can customize this view in the **Configure Dashboard Views** section of the **Administration** view .

What actions can be performed in the Administration view of the Idera Dashboard?

In the **Idera Dashboard** all products show a common **Administration** tab, granted the logged-in user has administrator privileges. Selecting this tab, displays the Administration view which hosts a range of sections for performing administration-related actions.

The **Administration** view of the **Idera Dashboard** provides a central set of services related to specific actions such as:

- [Managing users](#)
- [Managing Products](#)
- [Managing Instances](#)
- [Customizing Navigation Order](#)
- [Customizing DBA Order](#)

For more information on each service and what configuration settings are available, visit each respective section.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

-------------------------------	--------------------------	--------------------------	-------------------------	---------------------------	--------------------------	---------------------------	-----------------------

Managing users in the Idera Dashboard

The **Users** section of the **Administration** view allows users to grant access to other team members or groups and manage their roles. Users with administrative privileges are divided in:

- **Dashboard administrators** - capability to manage access over Dashboard functions as well as individual products functions.
- **Product administrators** - capability to grant access to individual products for which they have administrative rights.

To add new users, edit their details (name, subscription, or email address), or remove them, select **Manage Users** in the Administration view.

Adding a user in the Idera Dashboard

In the **Idera Dashboard**, access is granted to Windows users or groups. To add users follow these steps:

1. Click the **Add User / Group** option and the Add User/Group dialog displays.

2. Type the name of the user you want to grant access to. You should enter a Windows user name in the following format: **<domain\user>**.
3. Select **User** or **Group** in the Account Details field.
4. Check the **Do not timeout the browser session for this account** check box to stay logged in.
5. Check the **Send welcome email** check box to provide new user with information about the product and URL for the Idera Dashboard console.
6. Type the email address where you want the user to receive alert emails.
7. In the **Product** field you can select to add user to the **Idera Dashboard** or a specific product like SQL Safe.
8. If you select the first option (Idera Dashboard), in the **Role** field you can assign user the **Dashboard Administrator** or **Dashboard Guest** roles.
9. If you select the second option (SQL Safe or respective product), in the **Role** field you can assign user the Administrator, User, or Guest roles.
10. Click **SAVE**.

Editing a user in the Idera Dashboard

This option allows you to edit the account name, change the email address where user receive alerts, disable his/her account, and add new permissions. To edit a user or group follow these steps:

1. Click the **Edit** icon  next to the user you want to edit.
2. Change the necessary settings and/or click **Add New Permission** to grant the user access to the Idera Dashboard or other products and assign the respective roles.
3. Click **SAVE**.

Removing a user from the Idera Dashboard

This option allows you to remove a user from access to the Idera Dashboard. To delete a user or group follow these steps:

Tips

Grant users to access to the Idera Dashboard. The Idera Dashboard uses Windows authentication to validate users. Grant access by entering either user or group names in the form "domain\accountname". Users will log in to Idera Dashboard using their Windows credentials.

For each account, select the roles that they have in each Idera Product.

Manage Users

[Add User / Group](#)

Account	Type	Role	Edit/Delete
simpsons\administrator	USER	IderaDashboard : DashboardAdministrator	 
simpsons\guest	USER	IderaDashboard : DashboardGuest	 

1. Select one user from the list of users, click the **Remove** icon (as seen above).
2. A warning that requires a confirmation whether you want to delete the selected user or group displays.

SQL Safe is a high-performance backup and recovery solution for your SQL Servers. [Learn more >>](#)

Managing Instances in the Idera Dashboard

The **Idera Dashboard** tracks SQL Server instances discovered and managed by different Idera products. This includes instances managed by the product as well as those discovered on the network. This lets you review your entire SQL Server environment and its coverage in areas such as backup, security, and performance.

The **Instances** section of the **Administration** view, allows users to view and manage registered instances.

Take into account that instances are registered from individual Idera products. In this window you can view coverage or remove registered instances that no longer exist in your SQL Server environment, select **Manage Instances** in the **Administration** view, and the Managed Instances window displays. The View filter allows you to select from:

- **All**- Lists all instances discovered in your SQL Server environment and network.
- **Managed**- Lists only those managed instances in various Idera products.
- **Unmanaged**- Lists instances discovered on the network but not registered.

The screenshot shows the 'Managed Instances' window in the Idera Dashboard. The left sidebar has a 'Manage Instances' link highlighted with a red box and a red arrow pointing to it. The main panel displays a table of managed instances.

Configure Idera Dashboard views

The **Configure Dashboard Views** section allows users to customize which product widgets are shown in the **Overview** and **Details** view tabs of the **Idera Dashboard**.

Customizing Dashboard Views

1. Click the **Customize DBA Dashboard** link and a dialog displays.
2. In the **Customize DBA Dashboard** dialog you can try the following:
 - **Hide/Show DBA Dashboard** - You can choose to show the DBA Dashboard to all users, hide it, or show it to users with permissions in two or more products
 - **Add or remove columns** - By using these options, you can customize how many widget columns you want to view in your **Overview** or **Details** tabs.
 - **Select View** - Select if you want to apply the settings of this window to your **Overview** or **Details** tab.
 - **Add a Widget** - Use the drop-down option to select the widget you want to add to your view. You can specify in which column you want the widget to be displayed. Take into account that the option **Total Widgets** automatically updates the number of widgets you selected for your view.
 - **Set column widths** - Specify the width percentage of each column and click **APPLY**. Note that all your columns widths should sum up 100%.
 - **Replace/delete/move product widgets** - On each widget you can perform the following actions:
 - **Choose Another** - Use the drop-down options to select another available widget to be displayed instead of the current one. Note that you can only replace your current widget with other that is not currently displayed on your view.
 - **Delete** - Click the **X** icon on the upper right corner of each widget to remove it.
 - **Settings** - Use this option to specify the default setting for your widget on your view: **Expanded** or **Collapsed**.
 - **Move** - Drag and drop widgets to order them according to your view requirements.
