

SQL Data Compare Scripting Options

Scripting Options are listed on the second tab of the IDERA SQL Data Compare Options window. Those options affect the way the synchronization script is generated but do not affect the comparison operation.

- Transaction size.** Determines the max. size of the SQL Server transaction, under which the synchronization script runs. In some cases, the synchronization script can get extremely large, with millions of insert/update/delete statements. Wrapping such a large script in a single transaction may not be possible, due to the transaction size limitations, or acceptable, for performance and other reasons. Setting a max. transaction size is a way around these restrictions. If the transaction has a max. size, data compare commits the current transaction when the max. size is reached and starts a new one. To have a transaction with no upper limit, set the max transaction size to 0.

i Please use this option with caution. If you set a max. transaction limit and the synchronization process is canceled, only the current, open transaction is rolled back. Changes committed prior to that transaction are permanent and cannot be reversed. We strongly recommend, if possible, to leave the transaction unlimited, since it ensures that all changes in the database are either committed or rolled back.

- Batch size.** Determines the size of data that is transmitted to SQL Server in one execution. A transaction normally contains many batches, but the batch itself is a single unit of work that cannot be divided any further.

The screenshot shows the 'Data Compare Options' dialog box with the 'Scripting/Execution Options' tab selected. The 'Comparison Options' tab is also visible. The 'Scripting/Execution Options' section includes the following settings:

- ☐ Script updates via delete/insert statements
- ☒ Disable DML triggers
- ☐ Disable system-versioning of the temporal tables
- Drop/Create (dropdown) Action on foreign keys and edge constraints
- Local and Remote (dropdown) Stretched tables query scope
- ☒ Generate and execute a transactional script
 - Transaction size (in MB) 256 (up to 2048 MB)
 - Execution batch size (in KB) 16 (1 - 64)
- ☐ Log script execution
 - Log file (text box with browse button)

On the right side, there is a 'Description:' section with the text: 'Scripts and synchronizes data changes that require updates using delete and insert statements.'

At the bottom right of the dialog, there is a 'Restore Default Options' link and 'OK' and 'Cancel' buttons.
