Deploy the SQL Compliance Manager Agent to cluster nodes

Now that the IDERA Cluster Configuration Console is installed, you need to add the SQL Compliance Manager Agent to the clustered instance that is to be audited.

Use the following checklist to help you deploy and configure SQL Compliance Manager in a clustered environment.

vents.

1. Add the SQL Compliance Manager Agent

(i) You must perform these steps on all nodes of the cluster.

- 1. Once the Cluster Configuration Console launches, click Add Service.
- On the General dialog window, specify the name of the clustered instance to be audited by IDERA SQL Compliance Manager and click N ext.
- 3. On the Collection Server dialog window, specify the name of the server hosting the SQLcompliance Collection Service and click Next.
- 4. On the **SQLcompliance Agent Trace Directory** dialog window, specify the path on which trace files will temporarily reside before being transferred to the SQLcompliance Collection Service.
 - The path specified should be on a drive that is a part of the same resource group as the SQL Server instance to be audited.
- On the CLR Trigger Location dialog window, specify the path on which trigger assembly files will reside. The path specified should be on a drive that is a part of the same resource group as the SQL Server instance to be audited. Click Next.

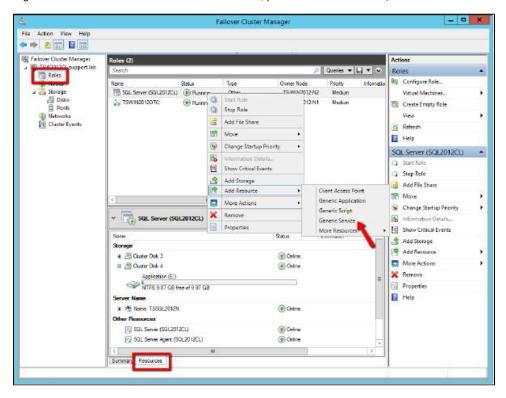

Ensure the Agent Trace directory and the CLR Trigger location specified exist by creating the folder structure manually through Windows Explorer.

- 6. Review the configuration and click Finish.
- The IDERA Cluster Configuration Console displays a confirmation message stating that you have successfully added the SQL Compliance Manager Agent. Click OK.

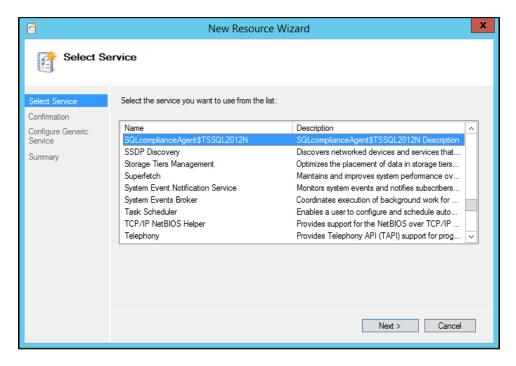

2. Register the SQL Compliance Manager Agent as a clustered service

Registering the SQL Compliance Manager Agent service with Microsoft Failover Cluster Manager allows the Microsoft Cluster Service to manage the SQL Compliance Manager Agent service in failover situations. This configuration ensures that auditing will continue during a failover and no audit data is lost.

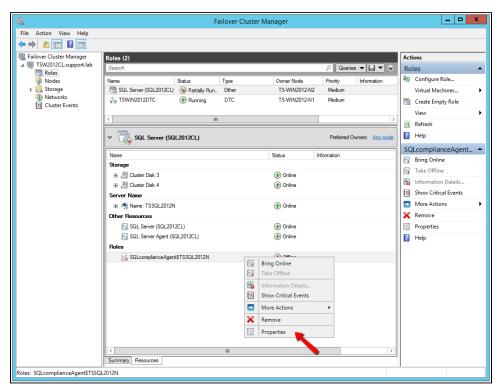

- **(i)**
- You must perform these steps only once, in the active node.
- 1. Log onto the active cluster node using an administrator account and launch the Microsoft Failover Cluster Manager.
- 2. Right-click the role created for the clustered instance, point to Add a Resource, and select Generic Service.

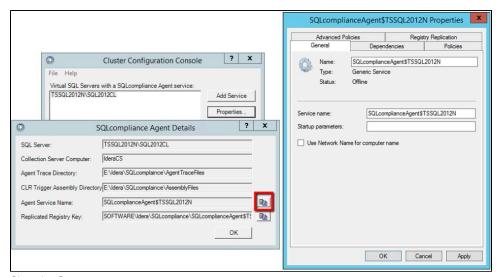

On the Select Service dialog window, select the SQL Compliance Manager Agent service created previously, continue following the wizard, and click Finish.

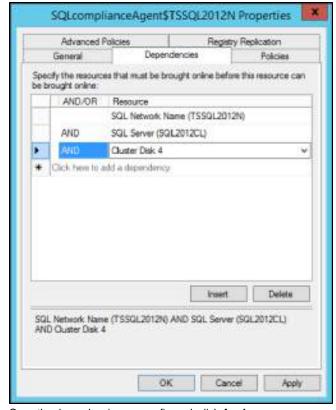

4. The Failover Cluster Manager displays the new resource in the resources tab. Right-click the new resource and select Properties.

5. In the General tab, specify the Service name as the Agent Service name found in the SQLcompliance Agent details.

- 6. Clear the Startup parameters.
- 7. Go to the **Dependencies** tab and add the following dependencies:
 - a. SQL Network Name: name of the cluster hosting the SQL instance to be audited.
 - b. Cluster Disk(s): the disk(s) on which the agent trace directory and the CLR trigger assemblies reside.
 - c. SQL Server: the SQL Server instance to be audited by SQL Compliance Manager.

- 8. Once the dependencies are configured, click **Apply.**
- 9. Return to the *General* tab, check the Use Network Name for computer name box and click Apply.
- 10. Go to the *Registry Replication* tab.

The Registry Replication tab is not available in Windows Server 2012.

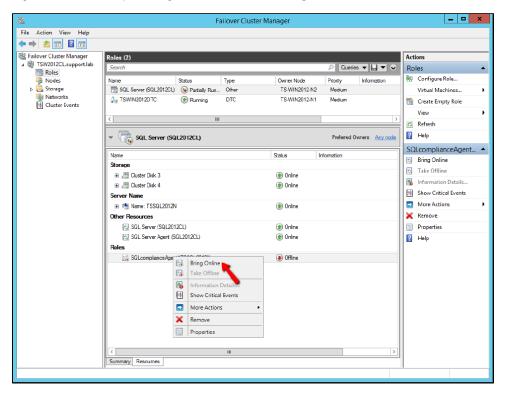

If you are using Windows Server 2012, you must use the "Add-ClusterCheckpoint" PowerShell cmdlet to add the necessary setting.

For more information, see Add ClusterCheckPoint.

Add a specific registry path. To obtain the correct path, go to the IDERA Cluster Configuration Console and copy the *Replicated Registry Key* from the *SQLcompliance Agent details*.

Click OK.

- 11. On the Properties window, click Apply to save the changes, and click OK to return to the Resources tab.
- 12. Right-click the SQLcompliance Agent resource and click Bring Online.

After successfully deploy the SQL Compliance Manager Agent, you can start auditing your virtual SQL Server instances.
