Take snapshot

To immediately collect a data snapshot (audit a SQL Server instance), right-click the server to audit, and select **Take Snapshot** from the context menu. You can right-click a server from the **Security Summary** view (Server in Policy tree) or **Explore Permissions** view (Audited SQL Servers tree).

The Take a Snapshot option can be found on several places in the IDERA SQL Secure console such as:

- Snaphshots top menu Take Snapshot Now
- Explore Permissions view Take Snapshot option located in the SQL Server Properties of the Server Summary when you click a server of the Audited SQL Servers tree.
- Explore Permissions view Take Snapshot option located on top of the Snapshot Summary when you click an existing snapshot of the Audited SQL Servers tree.

SQL Secure tells you who has access to what on your SQL Server databases. Learn more > >
