

## New features

SQL Defrag Manager provides the following new features:

### 3.6 New features

- **Recurring Automated Policies**  
SQL Defrag now allows policies to run more than once a day
- **Setting Up Automated Policies with Different Analysis Types**  
SQL Defrag now offers users the ability to run policies using different Analysis Types
- **New "Instant Defrag" tab**  
Rebuild or reorganize all the displayed fragmented hotspots at once with a click of a button

### 3.5.1 New features

- **Support for SQL 2019**  
SQL Defrag Manager now supports SQL Server 2019 and update .NET for Management Server and Data Repository
- **Cloud for Azure and AW EC2**  
Cloud environment for SQL Defrag to test on Azure and AW EC2. For more information visit [Cloud for Azure and AW EC2](#)
- **Support for Windows 2019**  
SQL Defrag Manager now supports Windows 2019 and updated .NET for console
- **Support for SQL Server 2019 Database**  
SQL Defrag Manager now supports SQL Server 2019 Database Platform
- **Support for databases in Azure**  
Support for databases hosted in Azure instances

### 3.5 New features

- **Support for SQL 2017**  
SQL Defrag Manager now supports SQL Server 2017.
- **Auto-discovery**  
A new option has been added to policies allowing users to configure auto-discovery of server objects when the policy runs
- **Show a table's schema**  
Hovering over a table in the **Targets** section of the **Policy wizard** displays a table's schema as a tool tip.
- **Recent Activity Configuration**  
Configure the maximum number of displayed items on the Recent Activity pane. You can find more information [here](#).

### 3.4 New features

- **This release does not add extra functionality**

### 3.3 New features

- **Import policies**  
Allows you to import policies from XML files. [Click here](#) to learn more.
- **Export policies**  
Allows you to export policies to XML files. [Click here](#) to learn more.
- **Navigation tree filtering option**  
Allows you to filter the items displayed in the SQL Defrag Manager Explorer by specific name or by keywords (using wildcards). [Click here](#) to learn more.
- **"Rediscover Objects" action for databases and tables**  
Allows you to quickly Rediscover Objects within a specific database or table. [Click here](#) to learn more.
- **Supports SQL Server 2014**  
SQL Defrag Manager supports the use of SQL Server 2014.
- **Includes a new CLI option that initiates a defragmentation from the command line**  
SQL defrag manager 3.2 includes a new command line option that initiates a defragmentation. Use the following CLI option:  

```
sqldefragc [[[-rebuild [online]] | -reorg] -instance <instance name>
> -database <database name> | -policy <policy name>]
```

 You have two options when using this code. You can:
  - Define the defragmentation as follows: specify "rebuild" or "reorg" where "online" is optional for "rebuild"; specify the "instance name"; and specify the "database name".
  - Define the defragmentation based on an existing policy by specifying the "policy name".
