

# View Change History

Each time an SQL file is saved, the local history of that file is recorded (changes made). Using the Local History command, you can view all changes made to the file. Local History is accessed via the shortcut menu of SQL Editor and selecting **Compare With > Local History**.

- The History view displays all recorded times the file was changed since its inception/introduction into the workspace.
- Double-click a time in the **History** view to access the **Text Compare** panel. It displays the text of the file after the change occurred at the time indicated in the **History** view.
