

Reconfigure the SQL Diagnostic Manager Services and Repository Database

The following steps will help you to reconfigure the SQL Diagnostic Manager Services and the Repository Database:

1. Launch the Management Service Configuration Wizard from the Start menu on the node acting as the role owner.
2. When the Welcome to the SQLdm Management Service Configuration Wizard screen opens, click **Next**.
3. On the Specify SQLdm Repository screen, specify the location and credentials the Management Service uses to connect to the Repository. Once you enter the required information, verify it by clicking **Test** and **Next**.
4. When you complete the configuration, click **Finish**.

Consider that, for each one of the other nodes, do a Failover and repeat the steps from 1-4

On the final wizard's screen, you can review the changes you made using this wizard. The Original Configuration and the New Configuration likely are the same. However, complete and exit the wizard by clicking **Finish**.

Finally, you can register SQL Diagnostic Manager with the IDERA Dashboard and access the product using a web browser. Check the instructions on how to [Register SQL Diagnostic Manager with IDERA Dashboard](#).
