

# Restoring Object Level Recovery

You can select to perform an **Object Level Recovery**. When you choose this option, the **Restore Wizard** opens with the following options:

- **Target** - in this section, you can select the SQL Server instance where you want to restore. Go to [Selecting the target instance for restore](#) for more detailed information.
- **Databases** - specify the databases you want to restore and the general location of the corresponding archive files. Go to [Selecting the Databases for restore](#) for more detailed information. Take into account that Tivoli Store Manager, Amazon S3 Cloud, or Microsoft Azure Storage are not available for Object Level Recovery.
- **Backup Sets** - choose which backup sets you want to use for restore. Go to [Selecting the Backup set for restore](#) for more detailed information.
- **Temporary Location** - select where to restore virtual databases. Type the path in **Temporary Location** and select your instance from the drop-down options.
- **Database Objects** - for each **Database Virtual Object**, specify in **Restore As** the name with which you want to restore your database virtual object and type your **File location**. You can also select the database objects to restore separately, such as tables, stored procedures, functions, views, schemas, etc.
- **Finish** - before clicking **Finish** to proceed with your restore operation, you can go to previous sections to review and make any necessary modifications.

For more information about recovering objects using SQL Virtual Database, click [here](#).

SQL **Safe** is a high-performance backup and recovery solution for your SQL Servers. [Learn more](#) > >
