Change which policies audit this instance

The **Policies** tab allows you to modify the policies to which the selected SQL Server instance is assigned. There are two kinds of policy memberships:

User-defined policy membership

A manual policy is a policy that must be manually assigned to a SQL Server instance.

Automatic policy membership

An automatic policy is a policy that is configured so that all SQL Server instances are automatically assigned to it.

SQL Secure tells you who has access to what on your SQL Server databases. Learn more > >
