

Database Full (Size) alert

The Database Full (Size) alert provides the amount of disk space, in megabytes, currently used by the database as the sum of data, text, and indexes. This value represents the actual amount of used data within the database file and does not represent the size of the database file itself.

SQL Diagnostic Manager raises this alert based on the database metrics collection interval specified in Server Properties. For more information, see [Set general server options](#).

Create an alert response bundle with the Database Full (Size) alert and related alerts. For additional information, see [Create alert response bundles](#).
