

Configure notifications for log shipping

The Notifications tab of the Log Shipping Policy wizard allows you to choose the log shipping statuses about which you want to receive alert notifications through email. Email notifications let you, and your staff, remotely monitor the status of the backups and restores you have automated with this policy.

The status of the log shipping operations determine the status of your policy. When your backups and restores are successfully completed on schedule, the policy is considered ok.

Choose the status you want to monitor, type the email address of each recipient, select the desired alert frequency for each operation, and then click **Next**.

Tip

You must configure your mail server settings before SQLsafe can send email notifications. Click **Configure E-mail** to check your settings. For more information, see [View active alerts in your SQL BI environment](#) for alert notifications.

When is the email sent?

SQLsafe sends an email to the specified recipients when the selected operation status occurs. Because SQLsafe checks the status of your backup and restore operations every minute, your alert notifications provide a real-time indication of the health of your log shipping policy and your primary and secondary servers.

However, how often you are emailed about a specific status update depends on the notification frequency setting you select. For example, if you want to receive an email whenever a backup fails, even when the failures occur sequentially, choose to receive notifications every time the event occurs.
