Health Recommendations and Alerts

Click here for 1.0 Documentation

SQL Elements performs health checks on your environment. From these health checks, SQL Elements provides you with health recommendations to give you a broad visibility of the status of your registered instances; for example, health recommendations let you know if you have databases with no backups, if your drives are at risk of being full soon, or if your instances are running too slow.

Additionally, you can enable/disable those health check recommendations that you wish or not to receive notifications from.
