Key new features in 1.1

Expanded Discovery & Registration

- The SQL Server instances discovery capabilities have been expanded to include domains and IP address ranges. These capabilities offer full discovery coverage for larger and more complex environments.
- The discovery process accomodates additional discovery methods on both standard and custom TCP ports.
- Ability to schedule environment scans to suit specific days or timeframes as needed with flexible scheduling capabilities for both browser service and computer scans.
- New option for importing lists of SQL Server instances for registration.
- The auto-registration process has been improved to allow users specify which SQL Server editions will be automatically monitored.

Reporting

- View inventory reports grouped by server attributes and annotations.
- Capability to export and print server inventory and health check recommendation reports as needed.

New Views

- New SQL licensing view that displays SQL Servers versions, how many instances they host, how many CPUs, etc., and the most important information to ensure adherence to Microsoft licensing compliance. This view is exportable and will help your internal licensing team as needed.
