Select databases

Use the **Membership** tab of the SQL Safe Backup Policy Wizard to select which SQL Server instances and databases you want to monitor with this policy. You can also exclude one or more databases from this policy.

To make your selections, click **Add/Remove Instances**, and then choose the instances from where you want to backup databases. Then select from the different options for choosing databases (**All Databases**, **All User Databases**, **All System Databases**, **Specific Databases**). By choosing one of the "All" database options, the policy will automatically include the relevant databases as they are added or removed on the server.

You may select databases from different servers for one policy.

When you choose the databases you need to backup you can also specify those ones that you want to exclude from your policy, for this option move the ones you want to exclude to the list on the left.

Once you select your databases, click **NEXT** to configure your backup options.
