

Monitors

Server monitoring is one of the base components of server management. The critical nature of servers require someone or something to constantly monitor the status of the managed servers. SQL DM for MySQL easily automates this tedious job and detects server problems as soon as they occur.

'Monitors' interface lets you access any server metric you can imagine.

The Monitors page shows a detailed display of server parameters and metrics. The left column displays the metrics that SQL DM for MySQL displays per server. For every server that you registered with SQL DM for MySQL, a column, with data pertinent to that server, is displayed. Some data is displayed as cumulative values (accumulated over a time frame that you can specify) while others are averaged over a time interval (typically per second).
