View Queries in real time

The rows returned by the `SHOW FULL PROCESSLIST` query to the MySQL server are stored in a table (named `processlist`) in the embedded database - one column for every column returned plus one additional column named `action`. The Action column contains an HTML string that is used for the various options that are provided by SQL DM for MySQL. This table is stored in a `MEMORY` type database (no disk storage) and only the data returned by the latest `SHOW FULL PROCESSLIST` for each server is saved.

Also, `PROCESSLIST` data is only retrieved when the corresponding page in the web interface is showing in one or more browser windows connected to SQL DM for MySQL.

THREADS

Localhost, Master +8

Localhost									Thread Count: 46		
ID	User	Host	DB	Command	Time (sec)	State	Info	Action
