

SQL Compliance Manager components and architecture

IDERA SQL Compliance Manager consists of a light, unobtrusive architecture that easily runs in your SQL Server environment with minimal configuration. All SQL Compliance Manager components run outside and separate from SQL Server processes. SQL Compliance Manager does not add to or modify any of your native SQL Server files or services.

Architecture

SQL Compliance Manager provides a robust, easy-to-use SQL Server audit and reporting solution. Behind a friendly user interface, SQL Compliance Manager offers a unique, loosely coupled architecture that is both flexible and extremely powerful. SQL Compliance Manager fits your environment, no matter how simple or complex.

The following diagram illustrates the components of the SQL Compliance Manager architecture.

Management Console

The Management Console is a centralized, intuitive user interface that allows you to easily and quickly modify audit settings, monitor events, and report on audit data. This user interface also provides the following information:

- Real-time status of audited SQL Server instances
- SQL Server login permissions
- Detailed logging of change activity
- Track and prove continual compliance using reports

Repository databases

The SQL Compliance Manager Repository is the central repository that tracks:

- SQLcompliance configurations, such as audit settings, server registrations, and console security
- Audited SQL Server events
- Alert messages
- SQL Compliance Manager Agent activity

The Repository consists of the following databases. For more information, see [How auditing works](#).

Repository Database Name	Description
SQLcompliance	Stores alert messages, audit settings, SQL Compliance Manager Agent events, Activity Report Card statistics, and other SQL Compliance Manager configurations.
SQLcompliance.Processing	Stores processing event data received from the SQL Compliance Manager Agent.
SQLcompliance.Instance	Stores processed events collected from a registered instance.
SQLcompliance.Instance_Time_Partition	Stores archived events collected from a registered instance.

Collection Server

The Collection Server processes trace files received from the SQL Compliance Manager Agent, stores audit data in the events and archive databases, and sends audit setting updates to the SQL Compliance Manager Agent. The Collection Server runs under the Collection Service account. By default, the Collection Server communicates with the Agents every five minutes (heartbeat) to write processed audit data to the event databases associated with the registered SQL Server instances.

SQLcompliance Agent

The SQL Compliance Manager Agent gathers SQL Server events written to the SQL trace, caching these audited events in trace files. By default, the SQLcompliance Agent calls the Collection Server every five minutes (heartbeat) to receive audit setting updates, and sends trace files for processing every two minutes. The SQL Compliance Agent runs under the SQL Compliance Agent Service account. For more information, see [How the SQL Compliance Manager Agent works](#).

Sensitive Column auditing is supported by SQL Compliance Manager Agent 3.5 or later. To use this feature, please ensure you upgrade your agent to at least version 3.5.

Command line interface

The command line interface (CLI) provides an interface for third-party tools so you can automate and schedule regular tasks, such as audit data archival and grooming, and perform diagnostic tasks. You can also perform integrity checks through the CLI. The CLI supports the following operations.

CLI Operations	Description
agentsettings	Lists the settings for the SQL Compliance Manager Agent running on a specific SQL Server instance.
archive	Archives audited events collected for registered SQL Server instances.
auditdatabase	Enables auditing on a new database, allowing to specify either a regulation guideline or a custom audit template.
checkintegrity	Verifies the integrity of audited events collected for a specific registered SQL Server instance.
collect	Collects trace data from the agent.
groom	Deletes audited events older than a specified age.
help	Displays the CLI Help.
listtriggers	Lists the CLR triggers for DML auditing on a specific registered SQL Server instance.
registerinstance	Registers a new SQL Server instance and applies audit settings.

removetriggers	Removes the CLR triggers from the subscriber table on the specific SQL Server instance.
serversettings	Lists the settings for the Collection Server.
timezones	Displays the time zones recognized by the computer hosting the Collection Server.
updateindex	Applies optimized Repository index configurations to existing events and archive databases.

Trace files and the trace directory

Trace files contain audited SQL Server events collected by the SQL Compliance Manager Agent. The SQL Compliance Manager Agent stores these temporary files in a secure directory on the audited SQL Server instance. When the set directory size threshold is reached, the SQL Compliance Manager Agent stops the SQL trace until the trace files are sent to the Collection Server for processing. When the set file size threshold is met, the trace file is cycled. You can configure the SQL Compliance Manager Agent trace file directory location as well as how the SQL Compliance Manager Agent manages these files, such as how often the agent sends trace files to the Collection Server. For more information, see [How the SQL Compliance Manager Agent works](#).
