

Discovered instances

SQL Elements continuously searches your network to find new SQL Server instances. To see newly discovered instances, go to the **Discovered** option on the **Instances** tab. SQL Elements shows you a list of those instances not monitored in your environment yet. From this view you can add or ignore instances.

Note

If you have the [auto-registration](#) option enabled, all newly discovered instances will be automatically registered. Those instances that were discovered before this option was enabled will remain on the Discovered view.

Adding instances

If you want to monitor some of these instances, click the respective checkboxes next to the instances you want to add, and then click **Add SQL Server instance** on the top right section of this view.

SQL Elements opens the wizard for adding new SQL Server instances, and automatically adds the names of the instances you selected before. For more information on how to register SQL Server instances, go to [Adding SQL Server instances](#).

Tip

On this view, you can find the Microsoft SQL version next to the instances status to help you decide which instances you want to add or ignore.

Ignoring instances

You can also choose to ignore any of these discovered instances; for this purpose, mark the checkbox next to the instance you wish ignore, and click the **Ignore** option located on the top right section of this window.

SQL Elements no longer shows the ignored instances on the **Discovered** view but adds them to the **Ignored** view.
