

Search a Project

You can search for certain text within a project and view the search results in the Search view on the Workbench.

To use the Search feature

1. Select **Search > File**.
2. Specify the search criteria:
 - Type the value to search in the **Containing Text** field. Use the * character to indicate wildcard string values, the ? character to indicate wildcard character values, and the \ character to indicate an escape character for literals (* ? /).
 - Select **Case Sensitive** and indicate to the search function that it should take into account case when searching for appropriate string matches.
 - Select **Regular Expression** to indicate to the search function that the string is a regular function.
 - In the **File Name Pattern** field, specify the extension name of the files to search for explicitly.
If the value in this field is a * character, the search function searches all files regardless of extension. Manually type in the extensions to indicate file type (separate multiple file types with commas), or click Choose and use the Select Types dialog to select the file extensions the process will search for the string by.
 - Select **Consider Derived Resources** to include derived resources in the search.
 - Select **Workspace** or **Working Set** to choose the scope of the search. If you choose Working Set, specify the name of the defined working set manually, or click Choose and navigate to the working set you want to search for in the provided string.
3. Click **Search**. The results of your search are generated in the Search view on the Workbench.
