"Rediscover Objects" action for databases and tables

Allows you to quickly Rediscover Objects within a specific database or table. Click here to learn more.

Supports SQL Server 2014

SQL Defrag Manager supports the use of SQL Server 2014.

• Includes a new CLI option that initiates a defragmentation from the command line SQL defrag manager 3.2 includes a new command line option that initiates a defragmentation. Use the following CLI option:

```
sqldefragc [[[-rebuild [online]] | -reorg] -instance <instance name
> -database <database name> | -policy <policy name>]
```

You have two options when using this code. You can:

- Define the defragmentation as follows: specify "rebuild" or "reorg" where "online" is optional for "rebuild"; specify the "instance name"; and specify the "database name".
- Define the defragmentation based on an existing policy by specifying the "policy name".
