

Google Cloud SQL Monitoring

For Google Cloud Monitoring you need the following prerequisites:

1. to create a service account in your Google Cloud account and download the content of the JSON file

To generate service-account credentials and view the public credentials already created, follow these steps:

- Open the [Service accounts page](#). When prompted, select a project.
- Click **CREATE SERVICE ACCOUNT**.

- In the **CREATE SERVICE ACCOUNT** window, type a name for the service account, and select **Furnish** a new private key. Click **Create**.
- When you create a key, your new public/private key pair is generated and downloaded to your machine.

2. To configure access to your Cloud SQL instance

Go to the [Cloud SQL Instances page](#) in the **Google Cloud Console**.

- From the client machine, use [What's my IP](#) to see the IP address of the client machine.
- Copy that IP address.
- Go to the [Cloud SQL Instances page](#) in the **Google Cloud Console**.
- Open the instance **Overview** page, and record the IP address.
- Select the **Connections** tab.
- Under **Authorized networks**, click **Add Network** and enter the IP address of the client machine.

The IP address of the instance and the MySQL client IP address you authorize must be the same IP version: either IPv4 or IPv6.

- Click **Done** and then **Save** at the bottom of the page to save your changes.

Adding your Google Cloud Server

To add your **Google Cloud Server** to SQL DM for MySQL, you need to follow these steps:

1. Provide the Host IP, MySQL Username, and Password to register your Google cloud SQL server in SQL DM for MySQL.

GCS

CONFIG **TAGS** **NOTIFICATIONS** **ADVANCED**

MYSQL HOST

35.222.174.100

MYSQL PORT
