

Compare assessment summaries

Use the **Compare Summaries** tab on the **Assessment Comparison** window to identify any differences in the security status of the two selected assessments. IDERA SQL Secure highlights each difference in yellow in the **Assessment Status** of each assessment.

The **Report Card Comparison Summary** shows where findings are equal (=) or not equal ().

From this tab, you can:

- Identify changes in risk level
- Compare security check findings
- Monitor whether security checks are enabled or disabled
- Monitor whether SQL Server instances are added or removed
- Review security status for all instances audited by each assessment

For a detailed comparison of each security check, see the [Compare Security Checks](#) tab. For more information, see [Compare Assessments](#).

SQL Secure tells you who has access to what on your SQL Server databases. [Learn more](#) > >
