

Configuring Nodes scenario

The Nodes scenario is recommended for users who want to audit regular databases and AlwaysOn databases on nodes that can be in PRIMARY or READ-ONLY SECONDARY nodes.

The SQL Compliance Manager administrator adds each node or instance of SQL Server involved in the availability group individually, which is the same process as with any regular SQL Server instance. You can then add any database that you want to audit. While you can automatically deploy the agent through the console, it is recommended that you manually deploy in case the automatic deployment fails. Note that the permissions requirements are the same as for the Listener scenario. For more information about permissions, see [Permissions requirements](#).

AlwaysOn databases running as the secondary replica do not appear in the Add Database wizard unless the replica is marked as read-only. Note that the default status is non-readable.

Review the following steps to manually deploy the agent service to all AlwaysOn node.

1. Start the SQL Compliance Manager Management Console.
2. Select the SQL Server instance to which you want to manually deploy the agent, and click **Add Server**. SQL Compliance Manager displays the **SQL Compliance Manager Configuration Wizard - Add Server**.
3. On the **Specify SQL Server** page, specify or browse the node, and click **Next**.
4. On the **Existing Audit Data** page, select the option to retain all of the previously-collected audit data and use the existing database, and click **Next**.
5. On the **SQL Server Cluster** page, check this option if the instance is a virtual SQL Server, and click **Next**.
6. On the **SQL Compliance Agent Deployment** page, verify that the **Manually Deploy** option is selected, and click **Next**.
7. On the **Select Databases** page, select the AlwaysOn database, and click **Next**.
8. SQL Compliance Manager displays the **AlwaysOn Availability Group Details** page. This page displays information about all nodes where the AlwaysOn database will be replicated. **Note that this page does not appear if the database is not AlwaysOn.**
9. Review the available information, and click **Next**.
10. On the **Audit Collection Level** page, select the **Default** audit level, and click **Next**.
11. On the **Permissions Check** page, verify that all permissions pass, and click **Next**.
12. SQL Compliance Manager displays the **Summary** page. Click **Finish**.

After adding all nodes, the SQL Compliance Manager displays the primary node, as shown in the following image. You also now can audit any AlwaysOn databases in the added nodes if they are in PRIMARY or READ-ONLY SECONDARY roles.

The screenshot shows the SQL Compliance Manager console interface. On the left, the 'Explore Activity' pane shows a tree view of 'Audited SQL Servers' including 'AOAGNODE1 (Primary)', 'TestBase', 'AOAGNODE2', and 'TestBase'. The main area is titled 'Audited SQL Servers' and contains several sections:

- Summary**: Includes icons for 'Register SQL Server', 'Monitor', 'Configure Access', 'Self-Audit', and 'Configure Alerting'. It also shows a 'Common Tasks' section with a '7 Days' span.
- System Status**: Displays a green checkmark and the text 'All servers are OK'. It lists statistics: Registered SQL Servers (2), Audited SQL Servers (2), Audited Databases (2), and Processed Events (9,776).
- Recent Alerts**: A table showing alert levels and counts: Severe (0), High (0), Medium (3,720), and Low (0).
- Enterprise Activity Report Card**: Includes a section for 'Event Alerts' with a list of categories: Failed Logins, Security, DDL, Privileged User, and Overall Activity. It also shows a table for 'Event Alert Activity Per Server' with columns for Server, Max, and Threshold.

Server	Max	Threshold
AOAGNODE1	1592/day	None
AOAGNODE2	426/day	None
