Customizing SQL Schema Compare

The command line provides a great deal of customization to meet your comparison requirements. It allows you to:

- Compare live databases or snapshot files
- Take a snapshot before comparing live databases.
- Include or exclude an entire class of objects by type, such as tables, views and more
- Include or exclude database objects by name
- Include or exclude database objects via schema filter
- Change the comparison options
- Change the filegroup comparison options
- Change the filestream filegroup comparison options
- Change the default mapping of various database objects

The following sections describe each scenario in details.

- SQL Schema Compare Excluding Objects
- SQL Schema Compare Changing Comparison Options
- SQL Schema Compare Entity Filters customization
- SQL Schema Compare Schema Filters
- SQL Schema Compare Changing Filegroup Settings
- SQL Schema Compare Changing Object Mappings
